Disclaimer

The information contained in these guidelines is a consensus of the development and consultation groups’ views on current treatment. They should be used in conjunction with any local policies/procedures/guidelines and should be approved for use according to the trust clinical governance process. Care has been taken in the preparation of the information contained in the guidelines. Nevertheless, any person seeking to consult the guideline, apply its recommendations or use its content is expected to use independent, personal medical and/or clinical judgment in the context of the individual clinical circumstances, or to seek out the supervision of a qualified clinician. The United Kingdom Oncology Nursing Society makes no representation or guarantee of any kind whatsoever regarding the guidelines content or its use or application and disclaim any responsibility for its use or application in any way.
These guidelines relate to the initial assessment and immediate management of Acute Oncology patients, i.e. patients presenting with an acute problem, demonstrating symptoms deemed as having been caused by:

- Systemic Anti-Cancer Therapy (SACT)
- Radiotherapy
- Malignant disease
- A previously undiagnosed cancer where an urgent oncology/haematology assessment is required

It is emphasised that these guidelines focus on initial assessment at presentation and management for the first 24 hours. Patients should be referred to, or discussed with the Acute Oncology Team as soon as possible following presentation. The Acute Oncology team will provide further advice and ongoing management guidance.

To aid in this urgent initial assessment, each protocol follows a RAG (red, amber, green) format and quick reference assessment, which is in line with the UKONS Oncology/Haematology 24-Hour Triage Tool (V2, 2016): [https://www.ukons.org/site/assets/files/1134/triage_tool_poster.pdf](https://www.ukons.org/site/assets/files/1134/triage_tool_poster.pdf)

The Common Terminology Criteria for Adverse Events (CTCAE Version 4.3), an international standard set of criteria for defining adverse events (AE) and their grading within clinical trials and the routine management of Oncology/Haematology patients, has been applied to assist with the recognition and management of AE: [http://www.hrc.govt.nz/sites/default/files/CTCAE%20manual%20-%20DMCC.pdf](http://www.hrc.govt.nz/sites/default/files/CTCAE%20manual%20-%20DMCC.pdf)

**Intended Audience**

These guidelines are intended for use by all health care professionals who assess and/or manage acute oncology patients at presentation. The guidelines may also be useful as an adjunct to the UKONS Triage tool when providing care advice following telephone triage (Appendix 1, P.56). They are mostly single-page “see-and-treat” guides. Whilst drug names may be referenced within a guideline, this is offered as a guide only; it is acknowledged that local variation may apply.

**Please be aware of NICE National Guidelines/Pathways for the management of:**

Metastatic malignant disease of unknown primary origin in adults: diagnosis and management: [https://www.nice.org.uk/guidance/cg104](https://www.nice.org.uk/guidance/cg104)

The development and consultation group worked to provide a set of generic guidelines based on national guidance and clinical expertise. They have now been reviewed and updated to ensure that they remain applicable and cover current best practice in the management of treatment induced toxicity and acute disease related complications.

The authors request that the original source is acknowledged in all copies or adaptations.
General Information and Management Principles

• Please consider drug toxicity as a possible cause of presenting problem. Systemic Anti-Cancer Therapy (SACT) includes cytotoxic chemotherapy, monoclonal antibodies, targeted agents, immunotherapy and new and novel therapies.

• SACT toxicities can cause acute deterioration but are often reversible if managed rapidly and appropriately. All patients on SACT may develop toxicities and are at risk; they may also have or develop additional toxicities to the one they are complaining of. Patients may be on new, novel, or trial therapy, and may present with unexpected or unknown side effects.

• Patients should know what treatment they are receiving, and have written information about their SACT and an alert card with their 24-hour advice line telephone number. These advice lines provide telephone triage and assessment for patients receiving treatment and will advise regarding the need for urgent assessment or review and follow up. In most cases, if a patient or carer telephones your department for advice it would be wise to redirect their call to the specialist advice line. However, if you are worried about the patient or their ability to give an accurate history, or you think that this may be a medical emergency then urgent medical review is essential.

• If a patient sounds unwell from SACT toxicities, it is sensible to arrange oncological/haematological review or assessment in hospital. If asking a GP or member of the primary health care team to review, it is essential to speak to them outlining what is required, what to look for and who to contact if further advice is needed.

• All licensed anticancer drugs have specific toxicities and the length of time that side effects can occur following completion of treatment varies. Most cytotoxic chemotherapies can cause side effects for up to 6 to 8 weeks after the last treatment is given. The newer immunotherapies and targeted agents can cause side effects for up to 2 years after the last treatment is administered – please ask for details and/or advice from the acute oncology team, the site specific specialist team, the hospital pharmacy or see the Summary of Product Characteristics: https://www.medicines.org.uk/emc/browse-medicines

• Please see specific toxicity guideline and manage the patient according to their condition, severity, concomitant medications and other medical problems.

• Aggressive management (including HDU/ITU) is appropriate if unstable, sometimes, even in the context of advanced cancer. Escalate care if the patient is becoming haemodynamically compromised/drowsy/shut down, discuss with specialist team if unsure of appropriateness.

• Organisations should consider using a standard triage and assessment format, such as the UKONS Triage Tool, for the assessment of patients with cancer. Assessment should include as standard the following questions:
  • Is the patient on active treatment (including radiotherapy) at present or have they received SACT treatment in the previous 2 years?
  • Names of SACT drugs and last date of treatment (NB may be on tablets)?
  • Performance status, general condition, ability to carry out normal function at home? Has this changed recently?

Eastern Cooperative Oncology Group: http://ecog-acrin.org/resources/ecog-performance-status
Karnofsky Performance Status: http://www.hospicepatients.org/karnofsky.html

• It is important to ask about all SACT related toxicities/problems in addition to the initial complaint, as several occurring together elevate risk and need closer management.
- Reversible toxicities and/or problems can be treated even in the presence of any DNACPR orders; decisions should be made on an individual basis. Please discuss with acute oncology/haematology consultant.

  - **Neutropenia can occur:**
    - At any time during a course of certain SACT or up to 6 weeks after
    - With certain radiotherapy treatment
    - At any time in a patient with disease-related immunosuppression

Patients with a suspected neutropenic sepsis will require IV antibiotics within 1 hour of presentation for assessment; this should be managed as per guideline 12 on P.20-21. ED/AMU Sepsis Screening & Action Tool;

- **Review concomitant medications and consider stopping** those that may affect renal function/potentiate hypotension (e.g. ACE-inhibitors, diuretics) if unwell or hypotensive, and benefits outweigh the risks of doing so.

- **Establish intravenous access**, or utilise indwelling lines if appropriately trained to do so, and hydrate according to clinical condition. Monitor fluid balance closely.

- **Patients require daily medical review and daily bloods may also be required** (watch for neutropenic sepsis/dehydration). **Be aware that administering paracetamol/antipyretics to neutropenic patients may mask signs of sepsis.**

- **Rectal examination.** Due to the risk of damage to rectal mucosa, it is recommended that in patients receiving SACT rectal examination is not performed. If it is deemed necessary to conduct rectal examination, this should be undertaken with caution.

- **The patient's site-specific specialist team providing cancer treatment must be informed** of any admission/assessment, as adjustments to the subsequent cycle may be required. If patient is in a clinical trial, the trials team should be contacted about the admission. team or on call oncology/haematology consultant.

- **Consider the involvement of the palliative care team** for symptom control advice if the problem is disease related.

Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible.

Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Guideline 1. ANAPHYLAXIS/ALLERGIC REACTION/HYPERSENSITIVITY - Requires IMMEDIATE medical assessment!

Hypersensitivity or an allergic reaction is an inappropriate and excessive reaction to an allergen; severity ranges from mild allergy to severe systemic reactions leading to anaphylactic shock if left untreated.

Anaphylaxis is a severe, life-threatening, generalised or systemic hypersensitivity reaction. It is characterised by rapidly developing, life-threatening problems involving: the airway (pharyngeal or laryngeal oedema) and/or breathing (bronchospasm with tachypnoea) and/or circulation (hypotension and/or tachycardia). In most cases, there are associated skin and mucosal changes.

Treat as an emergency according to Resuscitation Council Anaphylaxis Guidelines:
https://www.resus.org.uk/anaphylaxis/emergency-treatment-of-anaphylactic-reactions/

Signs and symptoms:
- Bronchospasm
- Cough
- Dizziness
- Dyspnoea
- Tachycardia
- Swelling of tongue/throat
- Hypersensitivity
- Headache
- Nausea, vomiting
- Urticaria/Pruritus/itching
- Asthenia
- Rash
- Rigors/chills
- Arthralgia
- Myalgia

Assessment: ABCDE approach
Observations: Calculate and monitor NEWS score. ECG cardiac monitoring

Differential diagnosis includes:
- Infusion reaction
- Septic shock
- Asthma
- Cytokine release syndrome
- Transfusion reaction

If this occurs during administration of treatment - STOP infusion/transfusion immediately

Grade 1 (Green)
Mild transient reaction: intervention or infusion interruption not required.

Grade 2 (Amber)
Intervention or infusion interruption indicated; all symptoms respond promptly to treatment (E.g. antihistamines; NSAIDS, IV Fluids).

Grade 3 (Red)
Prolonged signs and symptoms not rapidly responsive to medication and/or brief interruption of infusion or recurrence of symptoms following initial improvement

Grade 4 (Red)
Anaphylaxis – Airway, Breathing, Circulation problem - Life threatening consequences; urgent intervention required.

Treat reaction in line with local guidelines/policy.
Prophylactic medications indicated for 24 hours.
Telephone/review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen.

Patients with a good response to initial treatment should be warned about recurrence of symptoms and in some circumstances be kept under observation for 24 hours.

This includes the following:
- Severe reactions with slow onset
- Individuals with severe asthma or a severe asthmatic component
- Patients with a history of biphasic reactions

Patients who have had a suspected anaphylactic reaction should be treated and observed for at least 6 hours in a clinical area with facilities for treating ABC problems.

A senior clinician should review patient and a decision made about the need for further treatment or a longer period of observation.

Manage in accordance with trust local guidelines depending upon differential diagnosis.

Check that the patient is not neutropenic – If present, this should be managed as per guideline 12 on P.19-20 - Immediate antibiotics if sepsis suspected.

Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible. Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.
WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Resuscitation Council (UK)

Anaphylactic reaction?

Airway, Breathing, Circulation, Disability, Exposure

Diagnosis - look for:
- Acute onset of illness
- Life-threatening Airway and/or Breathing and/or Circulation problems
- And usually skin changes

Call for help
- Lie patient flat
- Raise patient's legs

Adrenaline

When skills and equipment available:
- Establish airway
- High flow oxygen
- IV fluid challenge
- Chlorphenamine
- Hydrocortisone

Monitor:
- Pulse oximetry
- ECG
- Blood pressure

1 Life-threatening problems:
Airway: swelling, hoarseness, stridor
Breathing: rapid breathing, wheeze, fatigue, cyanosis, SpO₂ < 92%, confusion
Circulation: pale, clammy, low blood pressure, faintness, drowsy/coma

2 Adrenaline (give IM unless experienced with IV adrenaline) IM doses of 1:1000 adrenaline (repeat after 5 min if no better)
- Adult: 500 micrograms IM (0.5 mL)
- Child more than 12 years: 500 micrograms IM (0.5 mL)
- Child 6-12 years: 300 micrograms IM (0.3 mL)
- Child less than 6 years: 150 micrograms IM (0.15 mL)

Adrenaline IV to be given only by experienced specialists
Titrated: Adults 50 micrograms; Children 1 microgram/kg

3 IV fluid challenge:
Adult: 500 – 1000 mL
Child: crystalloid 20 mL/kg

Stop IV colloid if this might be the cause of anaphylaxis

4 Chlorphenamine
(IM or slow IV)
- Adult or child more than 12 years: 10 mg
- Child 6 - 12 years: 5 mg
- Child 6 months to 6 years: 2.5 mg
- Child less than 6 months: 250 micrograms/kg

5 Hydrocortisone
(IM or slow IV)
- Adult or child more than 12 years: 200 mg
- Child 6 - 12 years: 100 mg
- Child 6 months to 6 years: 50 mg
- Child less than 6 months: 25 mg
Guideline 2. ARTHRALKIA/MYALGIA - Initial triage assessment within 15 minutes

Normally a symmetrical widespread joint pain but can also be associated with muscle pain (myalgia). Certain drugs can cause arthralgia, including: Taxanes, BRAF inhibitors, GCSF, Immunotherapies.

Identify: patients who have received/receiving systemic anti-cancer treatment or are at risk of disease related immunosuppression or a history of stem cell transplant, they may be myelosuppressed/neutropenic and at risk of sepsis. If present, this should be managed as per guideline 12 on P.20 - immediate antibiotics if sepsis suspected.

Observations: Calculate NEWS score.

Investigations: Urgent FBC, U&Es and Ca²⁺.

For patients receiving or received immunotherapy consider:

- Endocrine function panel – TSH and Free T4, ACTH, LH, FSH and Cortisol, Prolactin, Blood Glucose, +/- Testosterone/Oestrogen and refer to endocrinopathy guidelines on pages 28 to 36
- CK and ESR as initial assessment for Autoimmune Arthritis/Myositis. CRP measurement may also be useful.
- Consider viral infection as a cause of arthralgia. Discuss investigation and infection prevention with local microbiologist

Questions:

- Is there a cancer diagnosis/primary disease?
- Is the patient taking anticancer treatment at the moment or recently? If so what treatment and when did it stop?
- Has the patient taken anything for pain?
- Where is the pain? If not widespread then consider other causes of joint pain e.g. localised pain in isolated joint/back/spine may be related to metastatic deposit and need investigation and discussion.
- How long has the patient had the pain? Is the pain affecting what they can do?
- Has/is the patient receiving GCSF, filgrastim/pegfilgrastim injections? Some patients receiving GCSF may experience severe muscle pain commonly in the pelvic area, lower back and/or shoulders, which will usually improve after stopping GCSF. When was the last injection?
- Are there any comorbidities that may cause arthralgia/myalgia e.g. Autoimmune Rheumatoid Arthritis or Systemic Lupus Erythaematosis
- Is the patient on any blood thinning drugs or steroids?

<table>
<thead>

<th>Grade 2(Amber)</th>
<th>Grade 3(Red)</th>
<th>Grade 4(Red)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mild pain - not interfering with daily activities</td>
<td>Moderate pain - Interfering with some normal activities</td>
<td>Severe pain – and/or loss of ability to perform some activities</td>
<td>Bedridden or disabling</td>
</tr>
</tbody>
</table>

- You must check that the patient is not neutropenic if discharge home is being considered.
- Reassure the patient that this is normal, generally nothing to worry about and associated with treatment.
- Advise to observe temperature closely - if patient develops an abnormal temperature they must phone 24-hour advice line immediately.
- Review current analgesia and consider paracetamol, non steroidal (with caution as may not then develop a temperature in response to infection) or opiate if pain severity merits it.
- Heat - a heat pad, covered hot water bottle or regular warm baths. Advise patient to get plenty of rest and plan activities to include rest periods.
- Telephone/review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen.

- Advice and support measures as Grade 1 & 2.
  - You must check that the patient is not neutropenic if discharge home is being considered.
  - Review analgesia – consider codeine or opiate based or non-steroidal if not contraindicated, or neuropathic agent if appropriate.
  - Advise to observe temperature closely - if patient develops an abnormal temperature they must phone 24-hour advice line immediately.
  - Telephone/review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen.

- Ensure the patient is not neutropenic.
- Review analgesia – consider codeine or opiate based or non-steroidal if not contraindicated, or neuropathic agent if appropriate.
- Seek specialist oncology advice if pain is not settling.

Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible.

Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Guideline 3. BLEEDING AND/OR BRUISING - Requires IMMEDIATE medical assessment.

Bleeding can occur secondary to injury, disease, or as a side effect of treatment. It can be a life-threatening event if massive blood loss or spontaneous bleeding occurs.

Thrombocytopenia – is a reduction in the number of platelets in the blood. If platelet count is <50 bleeding and or bruising may occur with minor trauma.

Intracranial haemorrhage is more likely if there is sepsis and a platelet count of < 20

In a non-septic patient a platelet count of 10 or above may be adequate in the absence of additional risk factors for bleeding

Coagulation abnormalities – due to disease e.g. liver metastases or disseminated intravascular coagulation (DIC) or treatment e.g.

**Identify:** patients who have received/receiving systemic anti-cancer treatment or are at risk of disease related immunosuppression or a history of stem cell transplant, they may be myelosuppressed / neutropenic and at risk of sepsis. If present, this should be managed as per guideline 12 on P.20 - immediate antibiotics if sepsis suspected.

Many haematological disorders (malignant and non-malignant) can cause thrombocytopenia. Some patients, e.g. those with chronic lymphocytic leukaemia (CLL) or lymphoma may develop idiopathic thrombocytopenic purpura (ITP).

Consider viral infection e.g. parvovirus B19 as a cause of thrombocytopenia.

Patients who are receiving certain systemic anti-cancer treatment are at risk of thrombocytopenia

If present, these conditions should be managed according to approved guidelines.

**Observations:** Calculate and monitor NEWS score.

**Investigations:** Urgent FBC, U&Es, LFT. Consider group and cross match, coagulation screen, INR (if on Warfarin), APTT ratio (if on IV Heparin). Anti-Xa level if on low molecular weight (LMW) heparin, as it can accumulate in the presence of renal failure. Fibrinogen if considering DIC.

**Examination:** Associated symptoms: Light headed, pallor, clammy, thirst, rash (petechial/purpura/ punctate)

**Questions:**
- Is there a cancer diagnosis/primary disease?
- Is the patient taking anticancer treatment at the moment or recently? If so, what treatment and when did it stop?
- Is the patient actively bleeding? Site of active bleeding? Injury related or spontaneous?
- How much blood has the patient lost?
- Onset and duration – did bleeding and/or bruising start and how long has it persisted?
- Have they had similar bleeding and/or bruising before?
- Allergies/ current medications? - Anticoagulants, aspirin, clopidogrel, NSAIDS, DOACs (new anticoagulants e.g. rivaroxaban / apixaban) - NB Heparin can cause thrombocytopenia.

**Grade 1 (Amber)**

Bleeding - mild self limiting, controlled by conservative measures, ecchymosis, occult blood in secretions

Bruising - petechiae or bruising in a localised or dependant area, with or without trauma.

- Review blood results
- Manage neutropenia as per guideline 12 on P.19-20.
- Discuss abnormalities with on call haematologist or oncologist.
- Do not discharge a patient without prior discussion with on call haematologist or oncologist.
- Telephone/review patient within 24 hours and ask patient to contact the 24-hour advice line.

**Grade 2 (Red)**

Bleeding - loss of 1-2 units

Bruising - moderate petechiae, purpura and/or generalised bruising, with or without trauma.

**Grade 3 (Red)**

Bleeding - loss of 3-4 units

Bruising - generalised petechiae, purpura and/or bruising.

New bruises, without significant trauma.

- Manage according to emergency department resuscitation guidelines.
- Attention should be given to disease or treatment specific factors e.g. thrombocytopenia, advanced disease.
- Consider stopping any contributing medication if safe to do so e.g. anti-coagulants /NSAIDS/antiplatelet drugs – discuss reversal of anti-coagulants with haematology.
- All patients should be discussed with on call haematoto-oncologist and/or oncologist, who can provide further management advice.
- Admit for support and monitoring - Consider critical care management.
- Manage neutropenia as per guideline 12 on P.20.

**Grade 4 (Red)**

Massive bleeding loss of > 4 units.

Life threatening haemorrhage.

- IMEDIATE antibiotics if sepsis suspected.
- Discuss reversal of anti-coagulants with haematology.
- All patients should be discussed with on call haematoto-oncologist and/or oncologist, who can provide further management advice.
- Admit for support and monitoring - Consider critical care management.
- Manage neutropenia as per guideline 12 on P.20.

Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible.

Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

**WITHHOLD!** SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Guideline 4. CHEST PAIN - Requires IMMEDIATE medical assessment

Pain may result from a wide range of causes, there is an urgent need to diagnose the cause of any patient presenting with chest pain to ensure that serious and life-threatening conditions are not missed.

**Identify:** Patients within 6/52 of chemotherapy specifically patients currently receiving 5 fluorouracil (5FU) or capecitabine, which can cause coronary artery spasm. Patients may be taking these drugs orally at home or via continuous infusion. Other chemotherapy drugs/monoclonal antibodies can cause reduction in heart function, but this is not usually an acute presentation.

All cancer patients have an increased risk of pulmonary embolism.

**Observations:** Calculate and monitor NEWS score.

**Investigations:** Urgent FBC, U&Es, Cardiac markers/Troponin. Urgent ECG. Consider ABGs, CTPA.

**Questions:**
- Is there a cancer diagnosis/primary disease?
- Is the patient currently receiving 5FU/capecitabine?
- Does the patient have a history of angina, or other heart disease?
- Exacerbating/relieving factors, and characteristics of pain?
- Associated symptoms, e.g. SOB, syncope, oedema, palpitations
- Consider - is this pain cardiac?
- Differential diagnosis includes:
  - Cardiac cause
  - Pulmonary embolism (PE)
  - Metastases

**Advise Urgent A&E assessment for all symptoms of chest pain**

**Action:** Treat chest pain as ‘Red’ until proven to be non-cardiac/life threatening.

The aim is to exclude a life-threatening cause, which needs immediate treatment, from other causes of chest pain.

- If PE strongly suspected and same day CTPA not possible, consider commencing treatment with LMWH pending definitive investigation/diagnosis.

- Is the patient connected to an ambulatory intravenous infusion pump of 5 fluorouracil (SACT)? – If so arrange urgent disconnection.

- Is the patient taking oral SACT such as capecitabine? - If so ensure patient does not continue with this medication.

- These patients may also be myelosuppressed/neutropenic and at risk of sepsis. If present, this should be managed as per guideline 12 on P.19-20 - immediate antibiotics if sepsis suspected.

Admit for monitoring and on-going assessment and management in accordance with local trust guidelines.

Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible. Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Guideline 5. CONSTIPATION - Initial triage assessment within 15 minutes
Irregular and infrequent or difficult evacuation of the bowels; can be a symptom of intestinal obstruction or diverticulitis.

Identify: Patients who have received/receiving SACT or are at risk of disease related immunosuppression or a history of stem cell transplant. These patients may be myelosuppressed / neutropenic and at risk of sepsis. If present, this should be managed as per guideline 12 on P.20 - immediate antibiotics if sepsis suspected.

Observations: Calculate NEWS score. Presence of bowel sounds.
Investigations: Urgent FBC, U&Es, CRP, Ca²⁺, and LFT. Consider abdominal X-ray.

Questions:
- Is there a cancer diagnosis/primary disease?
- Is the patient taking anticancer treatment at the moment or recently? If so what treatment and when did it stop?
- When did the patient’s bowels/stoma move last? Are they passing wind?
- What is normal bowel habit? Any recent changes? N.B. loose runny stools could be overflow.
- What medication are they taking and has there been any recent changes? Certain medication can cause constipation e.g. anti-emetics (5HT3 Antagonists), opioids, SACT including vinca-alkaloids
- What food and fluids have they been taking over last few days? Decreased fluid and/or food intake can be significant factors in constipation
- Is there any nausea or vomiting?
- Is there any abdominal pain? Is it getting worse?
- Are they passing water/urine normally?

N.B. constipation may be a presenting symptom of MSCC or hypercalcaemia. Ascites can often aggravate constipation – if present consider drainage.

Differential diagnosis includes:
- Drug related e.g. SACT, opiates, anti-emetics.
- Bowel obstruction/ileus secondary to disease or ascites.
- Hypercalcaemia.

Grade 1 (Green)
Mild-no bowel movement for 24 hours over pre-treatment normal

Grade 2 (Amber)
Moderate-no bowel movement for 48 hours over pre-treatment normal

Grade 3 (Red)
Severe-no bowel movement for 72 hours over pre-treatment normal

Grade 4 (Red)
No bowel movement for > 96 hours - consider paralytic ileus or bowel obstruction

ACTION: Grade 1 and Grade 2
- Provide dietary advice including the importance of good fluid intake.
- Stop or change constipating drugs.
- Consider use of laxatives, faecal softener or stimulant
- Telephone/review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen or persist.

Grade 3
- Review medication and stop/change/avoid constipating drugs e.g. opiates, certain anti-emetics.
- Provide dietary advice including the importance of good fluid intake.
- Consider admission for investigation and management if associated with:
  - Abdominal pain
  - Nausea/vomiting
- Consider nil by mouth instructions and arrange surgical review if indicated.

Grade 4
Patients may also have:
- Severe abdominal pain and/or distension
- Nausea and Vomiting
- Faecal smelling vomit
- Rigid abdominal distension
- History of abdominal Surgery
Admit for:
- Further management and investigation.
- Senior medical and/or surgical review.
- I.V. access and fluid replacement.
- Consider nil by mouth instructions and naso-gastric tube placement.
- Analgesia
- Emesis control
- Monitoring

Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible.

Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Guideline 6. DIARRHOEA - Initial triage assessment within 15 minutes. (2 page guideline)

A disorder characterised by frequent and watery bowel movements. Grading is relative to normal baseline function.

Identify: Patients who have received/receiving systemic anti-cancer treatment or are at risk of disease related immunosuppression or a history of stem cell transplant. These patients may be myelosuppressed / neutropenic and at risk of sepsis. If present, this should be managed as per guideline 12 on P.20 - immediate antibiotics if sepsis suspected.

Observations: Calculate and monitor NEWS score.
Investigations: Urgent FBC, U&Es, Mg²⁺, LFT, CRP, phosphate. CDT screen. Consider checking total CO2 in serum or blood gases (arterial or venous) for pH/bicarbonate with severe diarrhoea and potential bicarbonate loss. Stool sample for C&S/ova/cysts/parasites to rule out infective causes of diarrhoea-e.g. Campylobacter/salmonella, and CDT screen. Abdominal X-ray.

Questions:
• Is there a cancer diagnosis/primary disease?
• Is the patient taking antinecancer treatment at the moment or recently? If so what treatment and when did it stop?
• Is the patient receiving radiotherapy to the abdomen or pelvis and when was their last treatment?
• How many stools a day above normal amount? Or how much stoma output is there above normal amount? Have they had any nocturnal movements? For how many days have they had diarrhoea? Is it interfering with activities of daily living?
• Are stools/stoma outputs formed, loose or watery? Any faecal incontinence or urgency? Any blood or mucous in the stool?
• Is there any abdominal pain e.g., cramping pains coming in waves?
• Is the patient able to eat and drink normally? Are they passing plenty of clear urine?
• Does the patient have any other SACT related toxicities, e.g. mouth ulcers, mucositis, nausea/vomiting, red hands/feet?
• Has the patient taken any antibiotics recently or been in hospital recently?
• What medication have they taken? Have they taken any laxatives or anti-sickness medication or any anti-diarrhoeal medication in the last 24 hours? If so what?

Differential diagnosis includes:
• Graft versus host disease in stem transplant patients – contact transplant haematologist urgently.
• Secondary to SACT e.g. 5FU or CAPECITABINE, IRINOTECAN, any TKI, please see next page and specific DRUG INFORMATION SHEET for further management guidance. Consider DPD deficiency.
• Gastrointestinal symptoms due to IMMUNOTHERAPY- proceed to guideline 21 on page 31 for further guidance.
• Infection
• Constipation with overflow
• Radiotherapy – secondary to treatment

Follow hospital infection control/prevention guidelines but -

DO NOT assume this is infective it is most likely to be drug induced in this group of patients.

Grade 1 Amber
Increase up to 3 bowel movements a day over pre-treatment baseline or mild increase in ostomy output.

Grade 2 (Amber)
Increase up to 4-6 episodes a day over baseline or moderate increase in ostomy output or nocturnal movement or moderate cramping.

Grade 3 (Red)
Increase up to 7-9 episodes a day or severe increase in ostomy output and/or any of the following:
• Incontinence
• Severe cramping

Grade 4 (Red)
Increase > 10 episodes a day or grossly bloody diarrhoea.

Review medication WITHHOLD DRUGS including any SACT that may be contributing until Acute Oncology or Site Specific team review.

ESCALATE TO RED for any of the following:
• Grade 2 and receiving or received immunotherapy treatment in the last 12 months
• Grade 2 for >24 hours despite anti-diarrhoeal medication
• Other symptoms e.g. temperature, nausea/vomiting, mouth ulcers, or clinical concerns
• Haematology patient
• Oncology - Consider loperamide initially. If ineffective consider Codeine Phosphate. Reduce and then stop antidiarrheal after 12-24 hours free of diarrhoea.
• Review any other SACT toxicities according to guidelines.
• Review all medications and stop prokinetics and laxatives once constipation with overflow has been ruled out. Avoid domperidone and metoclopramide anti-emetics.

Patients with grade 3 or 4 diarrhoea require specialist secondary care to manage symptoms - IV resuscitation may be required. They should be admitted for further assessment and active management. WITHHOLD SACT until Acute Oncology Team review and review all other medication as they may be contributing – if receiving Capcitabine or 5FU consider DPD deficiency. If receiving or received immunotherapy treatment in the last 12 months - follow guideline 21 on page 31. Haematology patients – discuss with haematology team.

Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible. Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota. WITHHOLD SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Guideline 6 continued. DIARRHOEA

Initial Management

1. Consider infective diarrhoea:
Isolate until infection excluded.
Send stool sample urgently - Inform microbiology and discuss management with microbiologist.
If haematology patient or strong suspicion of infective diarrhoea, withhold anti-diarrhoal medication until stool result available.
Give antibiotics according to local policy (e.g. for C.Difficile or neutropenic sepsis).

2. Consider graft versus host disease in stem transplant patients – contact transplant haematologist urgently.

3. Secondary to SACT e.g. 5FU or CAPECITABINE, IRINOTECAN, ERLOTINIB any TKI or Targeted Therapy please see specific DRUG INFORMATION SHEET for specific management guidance.

4. Gastrointestinal symptoms due to IMMUNOTHERAPY - proceed to guideline 21 on page 31 for further guidance.

5. Neutropenic Sepsis – if there is suspicion of, or potential for neutropenic sepsis start antibiotic management immediately as per policy (guideline 12 on page 20) – do not wait for FBC.

6. IV fluid resuscitation. Replace fluid and electrolyte losses. Adjust on-going fluids according to fluid balance status and renal function.

7. Full medication review - Stop ACE-inhibitors/ diuretics/ NSAIDs. NB Folic Acid can potentiate and increase side effects of some SACT drugs.

8. Nil by mouth (except sips) if abdominal pain or distension or abnormal abdominal X-ray.

9. Antidiarrhoal

Haematology - Discuss with haematology team on call before commencing antidiarrhoal.

Oncology:
Consider loperamide 4mg initially then 2mg after each loose stool (maximum16mg per 24 hours) N.B. Caution with high doses or prolonged use of loperamide as it can cause paralytic ileus.
If loperamide ineffective, then consider codeine phosphate instead of or in addition.
Reduce/stop antidiarrhoal after 12-24 hours free of diarrhoea.
If Grade 4 – consider the use of octreotide by sc injection and immediate IV broad-spectrum antibiotic (even if afebrile). Withhold if not on maximal antidiarrhoal prior to admission but review every 24 hours.
Do not withhold antidiarrhoal for more than 12-24 hours without thorough senior medical review.

10. Consider hyoscine butylbromide if abdominal spasms.
Guideline 7. **DYSPNOEA/SHORTNESS OF BREATH - Requires IMMEDIATE medical assessment.**

Difficulty breathing may include symptoms such as wheezing, choking, and a feeling of not getting enough air into lungs. Dyspnoea indicates a conscious appreciation of increased work done during breathing; principal factors in SOB are an increased work of breathing, increased ventilatory drive, impaired muscle function.

**Identify:** Patients who have received/receiving systemic anti-cancer treatment or are at risk of disease related immunosuppression or a history of stem cell transplant. These patients may be myelosuppressed/neutropenic and at risk of sepsis. If present, this should be managed as per guideline 12 on P. 20-- immediate antibiotics if sepsis suspected.

**Observations:** Calculate NEWS score.

**Investigations:** Urgent FBC, U&Es, Sputum and viral throat swab for C&S, blood cultures and CRP if pyrexial. ECG and CXR. Risk assess for VTE. Consider ABGs and troponin. Consider CTPA/VQ investigations to rule out pulmonary embolism, pneumonitis. Consider D-dimer. Serum β-D-glucan/galactomannan for fungal/Pneumocystis investigation in neutropenic/lymphopenic patients. If TB possible then test respiratory specimens for Mycobacterium tuberculosis. Consider GeneXpert PCR for TB in selected patients.

**Questions:**
- Is there a cancer diagnosis/primary disease?
- Is the patient taking anticancer treatment at the moment or recently? If so what treatment and when did it stop?
- Is there a history of dyspnoea? What is their normal level? Is this a new symptom?
- What is the patient's current medication?
- Is there any chest pain?
- What is the patient’s current medication?
- Is there any pain or swelling in legs? – Assess for signs of DVT.
- Are there any exacerbating/relieving factors?
- Are there any exacerbating/relieving factors?
- Is there any history of dyspnoea? What is their normal level? Is this a new symptom?
- Are there any exacerbating/relieving factors?

**Differential diagnosis includes:**
- Chest Infection
- Disease progression
- New cancer diagnosis or metastases
- Pleural effusion
- Consolidation
- Pulmonary embolism (PE)
- Superior vena cava obstruction (SVCO)
- Cardiac ischaemia
- Anaemia
- Pneumonitis
- Lymphangitis
- Exacerbation of respiratory condition e.g. Asthma

---

**Grade 1 (Amber)**

New onset dyspnoea with moderate exertion.

- Assess for signs of sepsis: such as productive cough, pyrexia, and /or generally unwell - escalate to Red as appropriate.
- Anaemia – consider correction.
- A history of underlying chest complaints e.g. asthma, COPD: advise patients around usual management of exacerbations and advice to discuss with GP or health professional managing this condition.
- You must check that the patient is not neutropenic prior to discharge.
- Telephone/review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen or persist.

---

**Grade 2 (Red)**

New onset dyspnoea with minimal exertion.

- Ensure the patient is not neutropenic – *If present, this should be managed as per guideline 12 on P.19-20* - immediate antibiotics if sepsis suspected.
- Admit if evidence of:
  - Desaturation
  - Infection
  - Other chemotherapy toxicities.

For management of:
- **SVCO** - see guideline 40 on P.52
- **Malignant Pleural effusion** - see guideline 37 on P.48
- **Carcinomatous Lymphangitis** – see guideline 29 on P.39
- **Pneumonitis** may be drug or radiation related:
  - **Radiation pneumonitis** - see guideline 39 on P.51
  - **Immunotherapy** induced pneumonitis – see guideline 24 on P.34
- Manage all other causes in accordance with local or national guidelines depending upon differential diagnosis:
  - **COPD** - [https://www.nice.org.uk/guidance/CG101](https://www.nice.org.uk/guidance/CG101)
- Consider possible infectivity of patient and implement respiratory isolation precautions as appropriate.

---

**Grade 3 (Red)**

New onset dyspnoea at rest.

---

**Grade 4 (Red)**

Life threatening symptoms requiring ventilatory.

---

Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible. Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
**Guideline 8. FATIGUE - Initial triage assessment within 15 minutes**

Fatigue is a subjective unpleasant symptom, which incorporates total body feelings ranging from tiredness not relieved by rest or sleep to total exhaustion creating an unrelenting overall condition that interferes with the individual ability to function to their normal capacity.

**Identify:** Patients who have received/receiving systemic anti-cancer treatment or are at risk of disease related immunosuppression or a history of stem cell transplant. These patients may be myelosuppressed / neutropenic and at risk of sepsis. If present, this should be managed as per guideline 12 on P.20 - immediate antibiotics if sepsis suspected.

**Observations:** Calculate NEWS score.

**Investigations:** Urgent FBC, U&Es, group and save, Ca²⁺, CRP, blood glucose, consider blood cultures. If the patient is receiving or has received immunotherapy in the past 12 months, check random cortisol, TSH and free T4.

**Questions:**
- Is there a cancer diagnosis/primary disease?
- Is the patient taking anticancer treatment at the moment or recently? If so what treatment and when did it stop?
- How many days have they been feeling like this?
- Do they have any pain? Have they taken any painkillers? If so, what?
- Are they able to eat and/or drink?
- Are they short of breath?
- Are they passing usual amounts of urine and are bowels functioning normally?
- Patient mood? Has their mood changed recently? Are they receiving any psychological support?

**Differential diagnosis includes:**
- *Anaemia*
- *Side effect of treatment*
- *Immunotherapy induced endocrinopathy*
- *Hormone disturbance e.g. thyroid dysfunction*
- *Patient entering the dying phase*
- *Disease progression*
- *Depression/psychological problems*

**Grade 1 (Green)**
Increased fatigue but not affecting normal level of activity.

- Check all blood results prior to discharge and escalate any abnormalities:
  - Neutropenia/pancytopenia
  - Endocrine disturbance in immunotherapy.
- Advice:
  - Encourage diet and fluids
  - Regular exercise.
- Consider psychological support measures.
- Telephone/review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen or persist.

**Grade 2 (Amber)**
Moderate or interfering with some normal activities.

- Check all blood results and escalate any abnormalities:
  - Neutropenia/pancytopenia
  - Endocrine disturbance in immunotherapy.
- Escalate if evidence of:
  - Dehydration
  - Infection
  - Poor oral intake
  - SACT toxicities.
- Consider possible disease progression.
- Telephone/review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen or persist.

**Grade 3 (Amber)**
Severe or loss of ability to perform some activities.

- Check all blood results and act on abnormalities e.g.
  - Neutropenia/pancytopenia *guideline 12 P.20*
  - Endocrine disturbance in immunotherapy *guidelines 18,19,20 on pages 28,29.,30.*
- Admit for:
  - Monitoring and continued assessment.
  - Management according to symptoms/blood results.
  - Contact the acute oncology team for advice on continuing anticancer therapy.
  - Consider possible disease progression.

**Grade 4 (Red)**
Bedridden or disabling.

- Check all blood results and act on abnormalities e.g.
  - Neutropenia/pancytopenia *guideline 12 P.20*
  - Endocrine disturbance in immunotherapy *guidelines 18,19,20 on pages 28,29.,30.*
- Admit for:
  - Monitoring and continued assessment.
  - Management according to symptoms/blood results.
  - Contact the acute oncology team for advice on continuing anticancer therapy.
  - Consider possible disease progression.

Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible. Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

**WITHHOLD!** SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
**Guideline 9.**
**METASTATIC SPINAL CORD COMPRESSION (MSCC)/ Cauda Equina Syndrome** - **IMMEDIATE medical assessment.**
MSCC is due to a pathological vertebral body collapse or direct tumour growth causing compression of the spinal cord. Irreversible neurological damage ensues with resulting paraplegia. Early diagnosis and treatment is essential.

**Identify:**
Patients with known diagnosis/history of cancer, or suspected new cancer diagnosis. Please note to rule out spinal cord compression, whole spine MRI scan must be performed within 24 hours of clinical suspicion.

**Patients who have received/receiving systemic anti-cancer treatment or have a history of stem cell transplant are at risk of disease related immunosuppression. These patients may be myelosuppressed / neutropenic and are at risk of sepsis. If present, this should be managed as per guideline 12 on P.20 - immediate antibiotics if sepsis suspected.

**Observations:** Calculate and monitor NEWS score.

**Examination:** Full neurological assessment and on-going review

**Investigations:** Urgent MRI whole spine within 24 hours of clinical suspicion. Urgent FBC, U&Es, LFT, Group & Save, bone profile. If considering myeloma/plasmacytoma then Immunoglobulins/electrophoresis, serum light chains and urine bence jones protein. If considering lymphoma then LDH. If new diagnosis of cancer consider appropriate tumour markers to aid diagnosis.

**Key signs/symptoms:**
The patient may or may not have a cancer diagnosis/primary disease.
Referred back pain that is multi segmental or band like.
Escalating pain, which is poorly responsive to treatment, including medication.
Different character or site to previous symptoms.
Funny feeling, odd sensations or heavy legs (multi segmental), pins and needles.
Lying flat increases back pain.
Pain, worsening on coughing or sneezing.
Agonising pain causing anguish and despair.
Gait disturbance, unsteadiness, especially on stairs (not just limp).
Sleep grossly disturbed due to pain being worse at night.
Established motor/sensory/bladder / bowel disturbances incontinence are late signs.

If you have suspicion of MSCC then contact the Acute Oncology team and/or MSCC coordinator for advice regarding management.

---

**Grade 1 (Amber)**
Mild paraesthesia, subjective weakness; no objective

- Rule out spinal cord compression – full neurological examination.
- Discuss with the Acute Oncology Team and/or MSCC Coordinator.
- MRI whole spine to be performed within 1 week of clinical suspicion.
- Advise on pain control.
- DO NOT discharge the patient until you are sure they do not have MSCC.
- If you do discharge the patient: Telephone/review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen/persist.

**Grade 2 (Red)**
Mild or moderate sensory loss, moderate paraesthesia, mild

- Rule out spinal cord compression/cauda equine - Urgent MRI whole spine.
- Treat as unstable spine until MRI results reported or oncology/neurosurgical assessment.
- Admit for monitoring and on-going assessment.
- Commence:
  - Dexamethasone 16mg stat dose followed by16mg daily
  - Analgesia
  - Thromboprophylaxis.

**Grade 3 (Red)**
Severe sensory loss, paraesthesia or weakness that interferes with function.

N.B. Note: need for caution in patients with no previous known malignancy and lymphoma suspected as steroids might cause rapid resolution of the tumour, which may make histological diagnosis very difficult. If possible, steroids should be avoided before biopsy if lymphoma suspected.

- Contact MSCC coordinator or oncologist on call to assess and plan treatment – radiotherapy or surgery-if required.
- All patients should start definitive treatment within 24 hours once MRI confirms a diagnosis of MSCC.
- See your local/network agreed algorithm for more detailed local guidance including contact details for the specialist team.
- Please consider Cancer of Unknown Primary (CUP), guideline 38 for patients who present with metastatic disease without a previous diagnosis of cancer.

For further information see NICE Metastatic Spinal Cord Compression guideline at:
http://pathways.nice.org.uk/pathways/metastatic-spinal-cord-compression#

---

Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible.
Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.
WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Guideline 10. MUCOSITIS/STOMATITIS/OESOPHAGITIS - Initial triage assessment within 15 minutes

An inflammatory reaction of the mucous lining of the upper gastrointestinal tract from mouth to stomach (mouth, lips, throat), and surrounding soft tissues.

Identify: Patients who have received/receiving SACT or are at risk of disease related immunosuppression or a history of stem cell transplant (PBSCT). These patients may be myelosuppressed/neutropenic and at risk of sepsis. If present, this should be managed as per guideline 12 on P.20 - immediate antibiotics if sepsis suspected.

Observations: Calculate NEWS score.

Investigations: Urgent FBC, U&Es, LFT, CRP, Lactate and Blood Cultures (Oncology patients - consider the need for pathology investigations in grade 1 and 2 presentations on an individual basis and in light of any other presenting symptoms or risk factors)

Examination and questions:

• Is there a cancer diagnosis/primary disease?
• Is this a haematology patient? If so please contact haematology team as soon as possible.
• Is the patient taking anticancer treatment at the moment or recently? If so what treatment and when did it stop?
• Is there evidence of super added infection? Does the patient have any blisters, ulcers or white patches on tongue/ lips mouth?
• Is there any pain or bleeding from the mouth?
• Are they able to eat and/or drink?
• Does eating or swallowing make the pain worse?
• Are they using any mouthwashes, painkillers or other treatments within the mouth?
• Do they also have diarrhoea?
• Is there any dryness, pain, inflammation of genitals and/or rectum – consider rectal mucositis.
• Are they passing usual amounts of urine?
• Have they had any recent radiotherapy treatment to the head and/or neck?

Differential diagnosis includes:

• Radiotherapy reaction
• SACT related
• Viral/bacterial infection
• Candidiasis

Consider the following mouth care advice:

• Ice chips for symptomatic relief.
• If painful: an anti-inflammatory mouthwash.
• Consider the use of a mucosal barrier gel.
• Analgesia: use care if advising antipyretic as it may mask signs of neutropenic sepsis.
• Assess for thrush/candidiasis and arrange for an antifungal agent to be prescribed if required.
• You must check that the patient is not neutropenic prior to discharge.
• Telephone/review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen or persist.

Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible. Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
### Identify:
Patients who have received/receiving systemic anti-cancer treatment or are at risk of disease related immunosuppression or a history of stem cell transplant. These patients may be myelosuppressed / neutropenic and at risk of sepsis. If present, this should be managed as per guideline 12 on P.20 - immediate antibiotics if sepsis suspected.

#### Observations:
Calculate NEWS score.

#### Investigations:
Urgent FBC, U&Es, LFT, Ca²⁺, blood cultures and CRP.

N.B. consider the need for pathology investigations in grade 1 and 2 presentations on an individual basis and in light of any other presenting symptoms or risk factors.

#### Questions:
- Is there a cancer diagnosis/primary disease?
- Is the patient taking anticancer treatment at the moment or recently? If so what treatment and when did it stop?
- How often are they feeling sick/nauseous?
- Have they been sick/vomited?
- Assess bowel movements, any symptoms that suggest constipation? Any diarrhoea? Bowel obstruction?
- What food and fluids have they been having over last few days?
- Any evidence of reflux/gastritis?
- Any signs of dehydration e.g. decreased urine output, fever, thirst, dry mucous membranes etc.
- What is the extent of the disease? – e.g. known metastases to brain, bone, liver etc.
- Are they taking any medication and has there been any recent change?
- Are they currently receiving radiotherapy? (Especially to brain, liver, GI Tract).
- Do they have any abdominal pain? Is this a new symptom?

### Differential diagnosis includes:
- Medication related e.g. SACT
- Hypercalcaemia
- Gastric stasis
- CNS disease
- Gastrointestinal infection
- Disease related

### Grade 1 (Green)
Able to eat and drink with a reasonable intake.
- Review prescribed antiemetic medication make sure dose / route and frequency are appropriate and assess patient compliance and understanding.
- Fully investigate cause:
  - Disease related e.g. brain or liver metastases, electrolyte imbalance, and obstruction
  - Medication related e.g. SACT, opiates etc.
- When cause has been clearly identified, change antiemetic in line with local policy directions.
- Advise self help measures:
  - Telephone/review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen or persist.

### Grade 2 (Amber)
Able to eat and drink but intake is significantly reduced.
- Admit for further assessment and management.
- IV fluids and electrolyte replacement as appropriate.
- Fully investigate cause:
  - Disease related e.g. brain or liver metastases, electrolyte imbalance, and obstruction
  - Medication related e.g. SACT, opiates etc.
- Prescribe antiemetic as appropriate to cause in line with local policy.
- Consider alternative route of administration of antiemetic’s e.g. syringe driver especially if associated with vomiting.

### Grade 3 - 4 (Red)
Inadequate or no oral caloric and/or fluid intake.
- Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible. Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.
- **WITHHOLD!** SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.

---

**Guideline 11. NAUSEA - Initial triage assessment within 15 minutes.**

Nausea is the sensation of being about to vomit. Acute chemotherapy induced nausea usually presents within the first 24 hours of receiving treatment. Delayed nausea may present any time after the first 24 hours and continues for up to 6 or 7 days after treatment.

**NAUSEA**
- Initial triage assessment within 15 minutes.
- Nausea is the sensation of being about to vomit. Acute chemotherapy induced nausea usually presents within the first 24 hours of receiving treatment. Delayed nausea may present any time after the first 24 hours and continues for up to 6 or 7 days after treatment.

- Telephone/review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen or persist.

**Grade 1 (Green)**
- Able to eat and drink with a reasonable intake.
- Review prescribed antiemetic medication make sure dose / route and frequency are appropriate and assess patient compliance and understanding.
- Fully investigate cause:
  - Disease related e.g. brain or liver metastases, electrolyte imbalance, and obstruction
  - Medication related e.g. SACT, opiates etc.
- When cause has been clearly identified, change antiemetic in line with local policy directions.
- Advise self help measures:
  - Telephone/review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen or persist.

**Grade 2 (Amber)**
- Able to eat and drink but intake is significantly reduced.
- Admit for further assessment and management.
- IV fluids and electrolyte replacement as appropriate.
- Fully investigate cause:
  - Disease related e.g. brain or liver metastases, electrolyte imbalance, and obstruction
  - Medication related e.g. SACT, opiates etc.
- Prescribe antiemetic as appropriate to cause in line with local policy.
- Consider alternative route of administration of antiemetic’s e.g. syringe driver especially if associated with vomiting.

**Grade 3 - 4 (Red)**
- Inadequate or no oral caloric and/or fluid intake.
- Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible. Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.
- **WITHHOLD!** SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Guideline 12. Suspected Neutropenic Sepsis - IMMEDIATE assessment. (2-page guideline)

Clinical suspicion of infection and potential for neutrophils <0.5x10^9/L (NICE)

START TREATMENT AT POINT OF SUSPICION!

Patients who have received or are receiving SACT or have a history of myelosuppression or known bone marrow failure have the potential for neutropenia.

Initial assessment:
Identify patients with clinical suspicion of infection and potential for neutrophils <0.5x10^9/L (received or are receiving SACT or history of myelosuppression or known bone marrow failure)

Patients may appear well initially but if untreated can rapidly progress to septic shock + death. Early diagnosis will normally prevent death.

Immediately: Take bloods and administer 1st IV antibiotics (DON’T wait for FBC result)

Door to needle time for first antibiotics should be less than one hour.

Urgent: FBC, U&Es, LFTs include albumin, Coagulation screen, G+S, Ca^{2+}, PO_{4}^{2-}, Mg^{2+}, Urate, CRP, and Lactate.

Peripheral and central line blood cultures, prior to antibiotic administration. Consider ABG and blood or plasma glucose.

Observations: Calculate NEWS score. Assess urine output

Commence: NEWS chart – patients can deteriorate rapidly and should be monitored closely. Monitor urine output.

Clinical assessment:

Full history (consider current or recent SACT) + examination

Assess urine output

Urine, sputum + stool cultures

Consider: throat swab, central line swab, wound swab and CXR

Early signs of SIGNIFICANT sepsis - YES

- Temp > 38°C or < 36°C or
- HR > 90 and /or RR > 20 or
- Generally unwell. Infective symptoms; Shivering/rigors; Diarrhoea

Commence Neutropenic sepsis management:

- ENSURE that 1st line antibiotics have been administered, DO NOT DELAY for lab confirmation
- Supplemental O_2
- 1L 0.9% sodium chloride over 1-2 hours
- Differentiate between sepsis and neutropenic sepsis
- Supportive measures

Admit to appropriate area

Identify: Potential sources of infection
Rx: Presenting complaint/co-morbidity
Tx: ECG, ABGs, Urinalysis, and Swabs

Ist line IV antibiotics in neutropenic sepsis as per NICE guideline:

- Beta lactam monotherapy with piperacillin with tazobactam as initial empiric antibiotic therapy for patients with suspected neutropenic sepsh if there are no patient-specific or local microbiological contraindications.
- Patients with penicillin allergy should be discussed with the on-call microbiologist
- Avoid aminoglycoside therapy in patients who have received platinum based chemotherapy in the last week
- Consider adding vancomycin /teicoplanin if CVAD is the suspected focus of infection

Do not perform a CXR unless clinically indicated

https://www.nice.org.uk/guidance/cg151/chapter/1-Guidance#managing-suspected-neutropenic-sepsis-in-secondary-and-tertiary-
Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible.

Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
### Guideline 12 continued. Suspected Neutropenic Sepsis

- Subsequent treatment should occur in an environment where appropriate skills and expertise are available.
- The patient should be closely monitored and the patient's risk of septic complications frequently reassessed using a validated risk scoring system (NICE 2012).
- If the patient continues to deteriorate despite initial treatment their condition should be discussed urgently with a senior clinician.

## DAY ONE – Day of Admission

**Monitoring**
- National Early Warning Score Chart (NEWS)
  - Every 15 minutes initially then regular monitoring according to patient's condition.
- Discontinue on admission; ensure safe disposal of unused chemotherapy.

**Chemotherapy drugs**

**Antimicrobials**

**Ist line antibiotics in neutropenic sepsis as per NICE guideline:** Offer beta lactam monotherapy with piperacillin with tazobactam as initial empiric antibiotic therapy to patients with suspected neutropenic sepsis who need intravenous treatment unless there are patient-specific or local microbiological contraindications. Review previous microbiology results for multi-drug resistance (MDR) carrier status, e.g. MRSA, and consider adding appropriate treatment if MDR present.

**Improving?** - if all antibiotics still required and route of administration. Discontinue empiric antibiotic therapy in patients whose neutropenic sepsis has responded to treatment, irrespective of neutrophil count.

**Unresponsive fever 48 hours?**
- Do not switch initial empiric antibiotics in patients with unresponsive fever unless there is clinical deterioration or a microbiological indication. Continue inpatient therapy in all patients who have unresponsive fever unless an alternative cause of fever is likely.

## DAY TWO

**Chemotherapy drugs**

**Antimicrobials**

**Improving?** - if all antibiotics still required and route of administration. Discontinue empiric antibiotic therapy in patients whose neutropenic sepsis has responded to treatment, irrespective of neutrophil count.

**Unresponsive fever 48 hours?**
- Do not switch initial empiric antibiotics in patients with unresponsive fever unless there is clinical deterioration or a microbiological indication. Continue inpatient therapy in all patients who have unresponsive fever unless an alternative cause of fever is likely.

### Additional antimicrobials: Therapeutic monitoring/dose adjustment - Liaise with pharmacy and microbiology.

- Do not offer an aminoglycoside, either as monotherapy or in dual therapy, for the initial empiric treatment of suspected neutropenic sepsis unless there are patient-specific or local microbiological indications.

- Consider viral and fungal infections, liaise with microbiology.

### Fluid and Electrolyte Balance

- Aggressive fluid replacement in dehydration.
- Hourly urine output measurement. Replace Na\(^+\) and K\(^+\) judiciously.
- Early critical care management if deterioration, severe sepsis (any evidence of organ failure) or suspected invasive fungal infection.

### Fluid and Electrolyte Balance

- Liaise with microbiology re interim results.
- Re-culture patient before changing antimicrobials.

- Monitor fluid intake and output. Maintenance fluids as required.

- Assess the patient's risk of septic complications according to NICE guidelines and MASCC score

**Discharge only if:**
- Low risk
- Physiologically stable
- When co-morbidity treated
- Neutropenic sepsis advice has been reinforced
- Discussed with a member of the acute oncology team

**NB.** Central lines may need to be removed in cases of severe sepsis, if unsure seek senior clinical support.
prior to discharge
Differential diagnosis includes:

Questions:
- Is there a cancer diagnosis/primary disease?
- Is the patient taking anticancer treatment at the moment or recently? If so what treatment and when did it stop? Is skin rash a commonly associated and sometimes serious toxicity of their treatment, please see specific DRUG INFORMATION SHEET.
- Have they received **immunotherapy**: see guideline 26 P.36.
- Have they received **oral targeted agents: EGFR antagonists, BRAF and MEK inhibitors**:; see guideline 14 P.24.
- Have they received **radiotherapy** recently: see guideline 15 on P.25.
- Have they had a stem cell/ bone marrow transplant? If yes contact the haematology team.
- If the patient has received **5FU, Capcitabine**: see guideline 16 on P.26.
- Are they otherwise well? Does the patient have any signs of infection e.g. pain, swelling, pustules, fever, discharge?
- Has the patient recently started any other medication including antibiotics?
- Does the patient have a history of skin complaints?
- Where is the skin rash, what % BSA does it cover and what does it look like
- Does the rash itch? Itch only, consider liver/kidney problems/ dry skin/ allergy.
- Has the patient been in recent contact with infectious disease e.g. shingles/chicken pox?
- Does the patient have any other SACT toxicity related symptoms; if so please see symptom specific guideline

Differential diagnosis includes:

*Side effect of medication  *Allergic reaction  *Infection  *Thrombocytopenia

**Grade 1 (Green)**
Rash covering <10% BSA, Macular/Papular eruption. Asymptomatic.

- **Provide appropriate skin care advice and emphasise the importance of skin care regimen** - See P.22.
- **Treat with emollient creams and antihistamines** if required.
- **Ask patient to contact 24-hour advice line if symptoms worsen or persist.**

**Grade 2 (Amber)**
If any of the following are present:
- **Pruritus, burning tightness**
- **Rash covering 10 -30% BSA**
- **Bleeding with trauma**
- **Affecting ADL or sleep**

- **Check all blood results and act on abnormalities.**
- **Discuss with Haematology /Acute Oncology Team prior to discharge.**
- **Treat symptomatically with emollient creams, antihistamines and consider topical or oral steroids** - See P.22.
- **IMMUNOTHERAPY see guideline 26 on P.35.**
- **Telephone/review patient within 24 hours ask patient to contact the 24-hour advice line if symptoms worsen/persist.**

**Grade 3/4 (Red)**
If any of the following are present:
- **Pruritic symptoms >30% skin surface**
- **Generalised Exfoliative**
- **Ulcerative Bullous dermatitis**
- **Spontaneous bleeding or signs of associated infection.**

- **Check all blood results and act on abnormalities.**
- **For unusual, severe or persistent rash, particularly if the patient is unwell –urgent referral to dermatology.**
- **Urgent admission if symptoms suggestive of Steven Johnson Syndrome or Toxic Epidermal Necrolysis.**
- **Analgesia, fluid balance monitoring and skin care support and advice -see P.22.**
- **Consider admission for support and assessment.**
- **Determine cause and treat appropriately, this may include I.V./oral or topical steroids.**
- **IMMUNOTHERAPY see guideline 26 on P.36.**
- **Oral targeted agents see guideline 15 on P.25.**

Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible. Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.

SKIN RASH

Initial management:

• Assessment of fluid balance status, establish IV access if any signs of dehydration or sepsis.
• Intravenous fluids according to fluid balance status and renal function.
• Treat any infected lesions as appropriate and adjust antibiotics according to clinical condition, myelosuppression, swab results and local antibiotic guidelines.
• Delineate and record area affected area – photograph.
• Check platelet count – rash may be secondary to thrombocytopenia.
• If ulcers: Topical acyclovir for lips/oral acyclovir for herpes infection in mouth.
• Consider that the rash may be infectious and consider infection prevention precautions.

On-going management:

• Reassess daily and continue close monitoring of routine observations as at risk of infection.
• Observe for development of sepsis, neutropenia, or other chemotherapy toxicities.
• Fluid balance or daily weights.
• Daily full blood count.
• Dermatology review if concerns/uncertainty of diagnosis.

Ensure general care measures:

• Good fluid intake
• Keep area clean and dry
• Avoid hot baths/tight clothes
• Mild soaps/cleansers/detergents.

Consider Prescribing:

• Topical creams/lotions (alcohol free, hypoallergenic e.g. E45) – apply regularly to all affected areas
• Anti-histamines if rash causes itchiness
• Analgesia if painful (caution with paracetamol/aspirin if risk of neutropenic sepsis)
• Oral or topical steroids may be required.

Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible.
Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Guideline 14. Skin Toxicities - Targeted therapy-related (Papulopustular rash)
Newer targeted anticancer therapies, particularly EGFR antagonists, BRAF, MEK and MTOR inhibitors, are frequently associated with skin toxicities, which are often seen in particular patterns and at different stages of treatment.

Papulopustular (“acneiform”) rash: predominately affects the scalp, face and upper trunk. Pruritus, irritation and pain may also be present

Xerosis (“dry skin”): usually develops gradually and may present with eczema and/or fissuring

Nail changes: include paronychia, onycholysis, splinter haemorrhages, and nail fold pyogenic granulomas

Hand-foot skin reaction: dysesthesia and paraesthesia can progress to localised, tender lesions, which may be bullous and severe. More common in plantar, pressure sites, heels and distal digits. Evolves to hyperkeratosis

Hair abnormalities: classically a reversible inflammatory, non-scarring frontal alopecia. Hair growth is slowed and textural changes can occur. Increased hair growth is also seen, particularly of the eyelashes and eyebrows. Hypertrichosis can also involve the face and chest.

Initial Assessment
Observations: Calculate NEWS score.
Investigations: FBC, U&Es
NB: Isotretinoin is not indicated for the treatment of papulopustular rash

Grade 1 (Green)
• Papules and/or pustules covering <10% BSA ± pruritus or tenderness.

• Topical acne treatment e.g. 1% Clindamycin lotion or gel.

Grade 2 (Amber)
• Papules and/or pustules covering 10-30% BSA ± pruritus or tenderness
• Limiting instrumental ADL
• Associated with psychosocial impact.

• Topical emollients e.g. Aveeno, Epaderm, Hydromol.
• Oral tetracyclines e.g. Lymecycline, Doxycycline.
• Antihistamines for itch if required e.g. Hydroxyzine.

Grade 3 (Red)
• Papules and/or pustules covering >30% BSA ± pruritus or tenderness
• Limiting self-care ADL
• Associated with local superinfection.

• Consider delaying treatment
• Management as for grades 1 and 2
• PLUS:
  • If local superinfection - Oral antibiotics are indicated
  • If extensive superinfection - IV antibiotics are indicated.

Grade 4 (Red)
• Papules and/or pustules covering any BSA ± pruritus or tenderness and are associated with extensive superinfection
• Life-threatening.

General management and advice (and management of other skin toxicity patterns)
For hand-foot skin reaction, see guideline 16 on palmar-plantar erythrodysaesthesia (PPE)
Patients should be advised on general skin care at the commencement of treatment.
The use of soap substitutes, light emollients, sun cream and alcohol-free lotions should be advised.
Emollient creams are preferred over ointments as they can increase acneiform eruptions, e.g. Aveeno, Epaderm, Hydromol.
Topical or oral steroids may be required.
Avoid tight footwear and damage to the nail and surrounding skin if nail changes are observed.
Trichomegaly of the eyelashes can cause discomfort and trichiasis, which should prompt referral to an Ophthalmologist.

Xerosis
Eczema
• Face & Neck: 1% Hydrocortisone cream
• Body: 0.05% Clobetasone Butyrate cream
• Treat secondary bacterial superinfection as guided by microbiology swabs.

Fissures
• Greasy emollients e.g. Hydromol ointment, 50% propylene glycol under clingfilm or plastic glove occlusion
• Fluoroxyacetic impregnated tape or Zinc oxide paste with salicylic acid.

Nail changes
Inflammation of nail folds
• Milton sterilising solution for 20 minutes daily
• Topical steroid/antifungal e.g. 1% Hydrocortisone/Miconazole cream.

Purulent paronychia
• Oral antibiotics.

Nail fold pyogenic granuloma
• Curettage and cautery.

Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible.
Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.
WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Guideline 15. Skin Rash - Radiotherapy reactions
A skin reaction is a common side effect following radiotherapy treatment to the breast, head and neck, perineum, and skin, but may occur for any treated area. Commonly there is mild erythema and pruritus similar to mild sunburn, but the skin may get sore and break down. Patients are told to expect this after 10-14 days and can last for 4-6 weeks after completion of treatment. This is usually simple to manage but for patients with treatment of the head and neck or perineum, it can be severe, very painful, and impair function.

Development of skin reactions depends on dose, fractionation, position and size of area treated, concurrent chemotherapy, and patient specific factors such as nutritional status.
NB. If the patient is receiving or has recently received SACT treatment please see skin rash guideline 13 on P.22

Grade 1 (Green)
Faint or dull erythema (RTOG1)
- Head and Neck – E45
- Skin– E45
- Pelvis – E45
- Breast – E45
- Other – E45
- Ask patient to contact the 24-hour advice line if symptoms worsen.

Grade 2 (Amber)
Tender or bright erythema without moist desquamation (RTOG 2a)
- Skin – Mepilex lite and E45 on surrounding areas
- Head and Neck – Pelvis – Breast – Other – E45
- Analgesia may be required.
- Telephone/review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen or persist.

Grade 3 (Amber)
Patchy moist desquamation, moist oedema (RTOG 2b)
- Appropriate conformable dressing as below:
  - Head and Neck – Mepilex Lite/Border (No Nu-Gel)
  - Skin – Mepilex Lite/Border
  - Pelvis – Nu-Gel, Sitz Bath and Fan Therapy
  - Breast – Mepilex Lite
  - Other – Mepilex Lite
  - Swab area if signs of infection and prescribe antibiotics as required.
  - Analgesia for pain – may require opiates.
  - Telephone/review patient within 24 hours and arrange regular review with the radiotherapy team to assess progress.
  - Ask patient to contact the 24-hour advice line if symptoms worsen.

Grade 4 (Amber)
Confluent moist desquamation. (RTOG 3)
- Appropriate conformable dressing as below:
  - Head and Neck – Mepilex Lite/Border (No Nu-Gel)
  - Skin – Mepilex Lite/Border, Allevyn Gentle, Atrauman.
  - Pelvis – Nu-Gel, Sitz Bath, Fan Therapy and Instilagel (around urethra).
  - Breast – Aquacel, Mepilex Lite/Border.
  - Other – Mepilex Lite/Border
  - Swab area if signs of infection and prescribe antibiotics as required.
  - Analgesia for pain – may require opiates.
  - Telephone/review patient within 24 hours and arrange regular review with the radiotherapy team to assess progress.
  - Ask patient to contact the 24-hour advice line if symptoms worsen.

The advice above is for a guide only and each patient should be assessed individually. If unsure about products to use please seek further advice.

For further information please see - https://www.sor.org/learning/document-library/skin-care-advice-patients-undergoing-radical-external-beam-megavoltage-radiotherapy-0

Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible. Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.
WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Guideline 16. Skin toxicity - PALMAR - PLANTAR ERYTHRODYSAESTHESIA (Hand foot syndrome)

A distinctive localised cutaneous reaction to certain antineoplastic agents. Symptoms include: Tingling or burning, redness, flaking/dryness, swelling, small blisters, sores on palms and/or sole.

**Identify:** Patients who have received/receiving systemic anti-cancer treatment or are at risk of disease related immunosuppression or a history of stem cell transplant. These patients may be myelosuppressed/neutropenic and at risk of sepsis. If present, this should be managed as per guideline 12 on P.20 - immediate antibiotics if sepsis suspected.

**Observations:** Calculate NEWS score.

**Investigations:** FBC, U&Es

**Questions:**

What SACT regimen is the patient on? When was the last dose?

Is this a continuous intravenous administration? E.g. 5-fluorouracil (5FU)

Is the patient still taking oral SACT? E.g. capecitabine, sunitinib.

Is the patient otherwise well? Any other symptoms e.g. diarrhoea/stomatitis? if yes refer to specific management guidelines:

- Diarrhoea - guideline 6, P.12
- Mucositis/stomatitis - guideline 10, P.18

Have they experienced this side effect before on previous treatment cycles?

Any signs of infection in the affected areas? – Discuss treatment options with the acute oncology team.

---

**Grade 1 (Green)**

Mild numbness, tingling, swelling of hands and/or feet, with or without pain or redness.

- Reassure the patient that this is recognised treatment related complication and generally nothing to worry about.
- Emphasise the importance of skin care regimen.
- Ask patient to contact 24-hour advice line if symptoms worsen.

**Grade 2 (Amber)**

Painful redness and or swelling of hands and/or feet.

- **Stop** the SACT until discussed with acute oncology or prescribing team.
- Reassure the patient that this is recognised treatment related complication and generally nothing to worry about.
- Emphasise the importance of skin care regimen.
- Consider prescription of high urea based cream.
- Telephone/review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen.

**Grade 3 (Amber)**

Moist desquamation, ulceration and severe pain in hands and or feet.

- **Stop** the SACT until discussed with the Acute Oncology Team.
- Review current analgesia (with caution as may not then develop a temperature in response to infection).
- Emphasise the importance of continuing skin care regimen.
- Consider prescription of high urea based cream.
- Consider specialist dermatology referral.
- Consider admission for further management if:
  - Signs of infection or other treatment related toxicities are present.
  - If receiving Capecitabine or 5FU and DPD deficiency is suspected.
  - If discharged - telephone/review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen.

---

Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible.

Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

**WITHHOLD!** SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
GUIDELINE 17.

VOMITING - Initial triage assessment within 15 minutes

The forceful expulsion of the contents of the stomach through the mouth, and sometimes the nose.

Identify: Patients who have received/receiving systemic anti-cancer treatment or are at risk of disease related immunosuppression or a history of stem cell transplant. These patients may be myelosuppressed / neutropenic fever and at risk of sepsis. If present, this should be managed as per guideline 12 on P.20 - immediate antibiotics if sepsis suspected.

Observations: Calculate NEWS score.

Investigations: Urgent FBC, U&Es, CRP, LFT, Mg²⁺, Ca²⁺, Glucose, Blood cultures and CRP, Cortisol, consider check CO₂ in serum, or blood gases (arterial or venous) for pH / bicarbonate due to H⁺ potentially causing metabolic alkalosis.

N.B. consider the need for pathology investigations in grade 1 presentations on an individual basis and in light of other presenting symptoms or risk factors.

Questions:
- Is there a cancer diagnosis/primary disease?
- What is the extent of the disease? – E.g. known metastases to brain, bone, liver etc.
- Is the patient taking anticancer treatment at the moment or recently? If so what treatment and when did it stop?
- How often are they being sick? And are they also feeling nauseous?
- Assess bowel movements, any symptoms that suggest constipation? Any diarrhoea? Bowel obstruction?
- What food and fluids have been taken over last few days?
- Is there any evidence of reflux/gastritis?
- Are there any signs of dehydration e.g. decreased urine output, fever, thirst, dry mucous membranes etc.
- Are there any signs of infection?
- Are they taking any medication e.g. steroids, and has there been any recent change?
- Are there any signs of infection?
- Are there any signs of infection?
- Are they currently receiving chemotherapy? From brain, liver, GI Tract
- Does the patient have any abdominal pain? Is this a new symptom?
- How is the patient fed? Do they have a feeding tube? Is this in the correct position?

Differential diagnosis includes:

- Medication related e.g. SACT
- Gastric stasis/ outlet obstruction
- Bowel obstruction
- Endocrinopathy
- Gastrointestinal infection
- Disease related
- Hypercalcaemia
- CNS disease
- Hyper-or-hypoglycaemia

Massc guidelines here: http://www.mascc.org/antiemetic-guidelines

**Grade 1 (Green)**
1-2 episodes in 24 hours.

☐ Review prescribed antiemetic medication make sure dose/route and frequency are appropriate and assess patient compliance and understanding.

☐ Fully investigate cause:
  - **Disease** related e.g. brain or liver metastases, electrolyte imbalance, and obstruction.
  - **Medication** related e.g. SACT, opiates etc.

When cause is clearly identified, change antiemetic in line with local policy directions.

☐ Telephone review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen or persist.

☐ Initial advice as for grade 1
  - Consider clinical review.
  - Telephone review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen or persist.
  - If symptoms worsen or are associated with other toxicities consider escalation to RED.

**Grade 2 (Amber)**
3-5 episodes in 24 hours.

☐ Admit for further assessment and management.

☐ IV fluids and electrolyte replacement as appropriate.

☐ Fully investigate cause:
  - **Disease** related e.g. brain or liver metastases, electrolyte imbalance, and obstruction.
  - **Medication** related e.g. SACT, opiates etc. If receiving Capecitabine or 5FU consider DPD deficiency.

☐ Consider placement of naso-gastric tube and nil by mouth order in suspicion of bowel obstruction.

☐ When cause is clearly identified, change antiemetic in line with local policy directions.

☐ Telephone review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen or persist.

**Grade 3 (Red)**
6-10 episodes in 24 hours.

☐ Admit for further assessment and management.

☐ IV fluids and electrolyte replacement as appropriate.

☐ Fully investigate cause:
  - **Disease** related e.g. brain or liver metastases, electrolyte imbalance, and obstruction.
  - **Medication** related e.g. SACT, opiates etc. If receiving Capecitabine or 5FU consider DPD deficiency.

☐ Consider placement of naso-gastric tube and nil by mouth order in suspicion of bowel obstruction.

☐ When cause is clearly identified, change antiemetic in line with local policy directions.

☐ Telephone review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen or persist.

**Grade 4 (Red)**
>10 episodes in 24 hours.

☐ Admit for further assessment and management.

☐ IV fluids and electrolyte replacement as appropriate.

☐ Fully investigate cause:
  - **Disease** related e.g. brain or liver metastases, electrolyte imbalance, and obstruction.
  - **Medication** related e.g. SACT, opiates etc. If receiving Capecitabine or 5FU consider DPD deficiency.

☐ Consider placement of naso-gastric tube and nil by mouth order in suspicion of bowel obstruction.

☐ When cause is clearly identified, change antiemetic in line with local policy directions.

☐ Telephone review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen or persist.

Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible.

Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute
Oncology or Site Specific Team.
Guideline 18. Endocrinopathies Adrenal Crisis Immune-Related Adverse Event (irAE)

Immune checkpoint inhibitors (ICPi) have been causatively associated with a number of endocrinopathies, including hypophysitis, hypopituitarism and adrenal insufficiency. Patients may present with nonspecific symptoms, which may resemble other causes such as brain metastasis or underlying disease.

Endocrine function panel:
TSH, Free T4, ACTH, cortisol prolactin, blood glucose, LH, FSH +/- testosterone/oestrogen
(9am cortisol is preferable but random cortisol measurement should be performed if the patient is unwell)

NB Values will be lab assay specific.

Mild – Asymptomatic (Grade 1)
Identified on routine blood test. Biochemical alteration in cortisol with serum level < 450 nmol/L.

- Hypoadrenalism is likely if cortisol is <100nmol/L.

Cortisol 100 - 450nmol/L
- Investigations:
  - Repeat cortisol at 9am within 48 hours.
  - Endocrine function panel if outstanding.

- Actions:
  - Monitor regularly (before each cycle as a minimum) and act as per algorithm if serum levels fall.
  - Continue immune checkpoint inhibitors (ICPi).

Cortisol <100nmol/L
- Investigations:
  - Endocrine function panel if outstanding.
- Treatment:
  - Commence hydrocortisone 10mg-breakfast
  - 5mg –lunch, 5mg – dinner.
- Actions:
  - Refer to endocrinology for advice/further investigation.
  - Give emergency advice/card about hydrocortisone.
  - Continue ICPi.

Moderate – Symptomatic (Grade 2)
Suspect endocrinopathy based on symptoms: Tiredness/fatigue, headache, weight loss, susceptibility to infection.

- Investigations:
  - Endocrine function panel if outstanding
  - 9am cortisol and ACTH
  - MRI brain with pituitary cuts.

- Cortisol (9am) >450 nmol/L
  - Adrenal insufficiency unlikely.
- Action:
  - Consider other causes of symptoms
  - Continue ICPi.

- Cortisol (9am) 100-450 nmol/L
  - Adrenal insufficiency possible.
- Actions:
  - Endocrinology referral
  - Standard endocrine panel plus IGF-1
  - Continue ICPi.

- Cortisol (9am) <100nmol/L
  - Adrenal insufficiency likely
- Treatment:
  - Commence hydrocortisone
  - 10mg- breakfast
  - 5mg –lunch, 5mg – dinner.
- Actions:
  - Endocrinology referral
  - Standard endocrine panel plus IGF-1
  - Give emergency advice/card about hydrocortisone
  - Continue ICPi.

Severe or Life-threatening (Grade 3 + 4)
Suspect adrenal crisis:
Hypovolemic shock
Hypotension –SBP <90mm Hg
Postural hypotension ->20mm Hg drop
Dizziness/Collapse
Nausea/Vomiting
Abdominal pain/tenderness/guarding
Fever
Confusion/delirium/coma
Hypotension/hyperkalaemia
Hypoglycaemia
Pre-renal failure
Severely unwell patient: severe dehydration, abdominal pain, or shock.

- Investigations:
  - Send endocrine function panel bloods immediately.
  - Admit patient.

- Immediate management with an ABCDE approach.

- Immediate bolus injection of 100 mg hydrocortisone i.v. or i.m. followed by continuous intravenous infusion of 200 mg hydrocortisone per 24 h (alternatively 50mg hydrocortisone per i.v. or i.m. injection every 6h).

- Rehydration with rapid intravenous infusion of 1000 mL of isotonic saline infusion within the first hour, followed by further intravenous rehydration as required (usually 4 – 6 L in 24 h; monitor for fluid overload in case of renal impairment and in elderly patients).

- Urgent Endocrinology referral for urgent review of the patient, advice on further tapering of hydrocortisone, investigation of the underlying cause of disease including diagnosis of primary vs secondary adrenal insufficiency.

- Rule out superadded infections.
- Withhold the next cycle of ICPi.

CAUTION:
- If a delay in endocrinology review is anticipated then commence hydrocortisone - 10mg- breakfast, 5mg –lunch, 5mg – dinner. This will ensure patient safety until endocrinology review.
- If the patient is currently on steroids (prednisolone/dexamethasone) then serum cortisol will likely be suppressed – please discuss with the endocrinology team before commencing replacement.
- If thyroid function is also compromised within a hypopituitary picture ensure cortisol is replaced for 24 - 48 hours prior to commencing thyroid replacement (for which the grade 1 hypothyroidism guidelines should be instituted – guideline 20.30).
- Society for Endocrinology [SfE] guidelines for adrenal crisis: www.endocrineconnections.com/content/5/5/G1

Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible.
Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.
WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Guideline 19. Endocrinopathies - Hypophysitis Immune-Related Adverse Event (irAE)

Clinical presentation
Typically, hypophysitis presents with headache, fatigue and visual loss. There are a range of non-specific symptoms including nausea, diarrhoea, malaise and anorexia, which may represent pituitary dysfunction and a low threshold for clinical suspicion is required. However, these typical symptoms are common in patients with complications of cancer undergoing SACT and other

Endocrine function panel:
TSH, Free T4, ACTH, cortisol prolactin, blood glucose, LH, FSH +/- testosterone/oestrogen
(9am cortisol is preferable but random cortisol measurement should be performed if the patient is unwell)
NB Values will be lab assay specific.

Vague symptoms:
- Mild fatigue
- Anorexia
No headache or
Asymptomatic

Moderate symptoms:
- Headache but no visual disturbance or
- Fatigue/mood alteration but haemodynamically stable, no electrolyte disturbance.

Severe electrolyte disturbance

Investigations
- Complete endocrine function panel.
- FBC, U&Es, LFT.
- MRI pituitary protocol to confirm diagnosis- exclude cerebral metastases.
- Consider formal visual field assessment.
- NEWS monitoring.

Treatment:
- Consider oral prednisolone 0.5-1 mg/kg /day to reduce pituitary oedema, if headaches or neurological problems are present.
- Start steroid therapy after sending endocrine function panel.

Actions:
- Refer to endocrinology
- Replace cortisol and/or thyroxine according to endocrinology guidance. Refer to IrAE management guidance on treatment of hypoadrenalism and thyroid dysfunction for replacement doses and further management – Guidelines 18 and 20, (P. 27,29).
- Withhold ICPi until symptoms controlled and consider restarting once patient stable.

Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible. Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.

CAUTION: If thyroid function is also compromised within a hypopituitary picture ensure cortisol is replaced for 24 - 48 hours prior to commencing thyroid replacement (for which hypothyroidism guidelines should be instituted – guideline 20 P.29).

- Society for Endocrinology [SfE] guidelines for adrenal crisis: www.endocrineconnections.com/content/5/5/G1
Thyroiditis and autoimmune Grave’s disease hyperthyroidism can occur as well as primary hypothyroidism. Development of, in some cases profound, hypothyroidism that is frequently persistent and requires long-term replacement. Presenting with asymptomatic hyperthyroidism, before return to normal levels for a brief period. This is nearly always followed by a hypothyroid state.

Immune checkpoint inhibitors (ICPi) have been causatively associated with a number of endocrinopathies, including hypothyroidism. Observational studies have shown that there is a typical pattern of thyroid specific biochemical disturbance presenting with asymptomatic hyperthyroidism, before return to normal levels for a brief period. This is nearly always followed by the development of, in some cases profound, hypothyroidism that is frequently persistent and requires long-term thyroid replacement. Smaller subsets of patients develop isolated hypothyroidism over a period of weeks. Both groups appear to require long-term replacement in a majority of cases. Thyroiditis and autoimmune Grave’s disease hyperthyroidism can occur as well as primary hypothyroidism.

**Hypothyroidism**

TSH of >10 mULN and Free T4 < lower limit of normal (LLN) NB Values will be lab assay specific.

**Symptoms:**
- fatigue – weakness
- sensitivity to cold
- weight gain or difficulty losing weight
- coarse, dry hair and dry skin
- hair loss
- muscle cramps and aches
- constipation
- depression
- irritability
- memory loss
- abnormal menstrual cycles
- decreased libido
- the following may occur in severe cases:
- slowed speech
- jaundice
- increase in tongue size.

**Investigations:** Endocrine function panel if outstanding.

**Treatment:**
- Commence Levothyroxine at 75 mcg or 25 mcg for high risk patients.
- Consider starting Levothyroxine at 25 micrograms in profoundly hypothyroid patients to avoid palpitations.
- **Caution** with high-risk patients - history of/or existing cardiac conditions e.g. Atrial fibrillation and elderly patients.

**Actions:**
- Recheck TFTs and cortisol with next cycle of treatment – note TSH will not fall for 4-6 weeks after starting levothyroxine.
- Discuss with endocrinologist to identify best pathway for long-term management and monitoring (primary/secondary care).
- Refer to endocrinologist if unable to stabilise.

**Hyperthyroidism**

TSH <0.40 mULN and Free T4 > upper limit of normal (ULN) NB Values will be lab assay specific.

**Symptoms:**
- fatigue or muscle weakness
- hand tremors
- mood swings
- nervousness or anxiety
- rapid heartbeat
- heart palpitations or irregular heartbeat
- skin dryness
- trouble sleeping
- weight loss
- increased frequency of bowel movements
- menstrual disturbance.

**Investigations:** Endocrine function panel if outstanding.

**Added Investigations:**
- TSH Receptor Ab, anti-TPO Ab, nuclear medicine thyroid uptake scan.
- Consider B-blocker - Propranolol or Atenolol.
- Painful thyroiditis – consider prednisolone 0.5mg/kg and taper.
- Consider Carbimazole if TSH Receptor Ab positive – seek endocrinology advice.

**Actions:**
- Recheck TFTs and cortisol within 1-2 weeks and every 1-2 weeks thereafter.
- Once hypothyroid - manage as per hypothyroidism.

**Symptomatic:** majority of cases become hypothyroid within a matter of weeks. If persistent manage in collaboration with an endocrinologist.

**Asymptomatic:** majority of cases become hypothyroid within a matter of weeks.

Always make sure that the Acute Oncology Team are informed of the patient’s assessment and/or admission as soon as possible. Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota. WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Gastrointestinal (GI) irAEs are among the most common, if they are left unrecognised or untreated, they can become life threatening. These toxicities can be managed effectively in almost all patients by using established guidelines that stress vigilance and the use of corticosteroids and other immunosuppressive agents when necessary. As with all irAEs this can be a delayed effect of treatment and can occur up to 12 months after completion of treatment.

### Mild (Grade 1)
- < 4 stools/day over baseline
- NO history of abdominal pain, mucous/blood in stools.

**Investigations:**
- Baseline bloods (FBC, U&Es, LFT, TFTs, cortisol & CRP)
- Stool microscopy and culture
- Clostridium difficile test
- Faecal calprotectin (if symptoms persist).

**Treatment:**
- Loperamide (use with caution as may mask symptoms of worsening colitis)
- Encourage fluids
- Avoid high fibre and lactose.

**Actions:**
- Telephone assessment within 3 days
- Continue Immune checkpoint inhibitors unless on combination anti-PD1/CTLA4 then consider withholding treatment.

**Symptoms:** Persist (≥5 days) or worsen or are associated with deranged U&Es.

### Moderate (Grade 2)
- If any of the following symptoms are present:
  - >4 stools/day over baseline
  - Moderate abdominal pain/cramps/discomfort
  - Mucous in stool regardless of number of stools
  - Nocturnal stools
  - Persistent grade 1 symptoms.

**Investigations:**
- Baseline bloods (FBC, U&Es, LFTs, TFTs, cortisol & CRP)
- Stool microscopy and culture
- Clostridium difficile test
- Faecal calprotectin (if symptoms persist)
- Polymerase chain reaction (PCR) screen Abdominal X-Ray and consider CT abdomen/pelvis.

**Treatment:**
- Methylprednisolone 0.5-1 mg/kg/day + PPI
- Fluid balance and replacement as appropriate (inc. dioralyte sachets).
- Flexible sigmoidoscopy with biopsies (inc. CMV staining).
- Screen for Inflimab administration suitability on admission to avoid delay if treatment is required - to include TB test, hepatitis screen, HIV, chest X-Ray (if chest CT not already performed).

**Refer and review by gastroenterologist**
**Use analgesia with caution.**

**Actions:**
- Withhold next dose of ICPI
- Daily telephone monitoring
- Gastroenterology advice/review (consider endoscopy).

**Assess response to treatment within 72 hours.**

### Severe or Life-Threatening (Grade 3 + 4)
- If any of the following symptoms are present:
  - ≥6 stools/day over baseline
  - Severe abdominal pain
  - Fever
  - Dehydration
  - Blood in stool
  - Incontinence
  - Limiting ADLs
  - Episodes within 1 hour of eating.

**Investigations:**
- Baseline bloods (FBC, U&Es, LFTs, TFTs, cortisol & CRP)
- Stool microscopy and culture
- Clostridium difficile test
- Faecal calprotectin (if symptoms persist)
- Daily bloods (FBC, U&Es, LFTs & CRP)
- CT Abdomen/pelvis
- Flexible sigmoidoscopy with biopsies (inc. CMV staining)
- Screen for Infliximab administration suitability on admission to avoid delay if treatment is required - to include TB test, hepatitis screen, HIV, chest X-Ray (if chest CT not already performed).

**Admit patient**

**Use analgesia with caution.**

**Actions:**
- IV hydration and fluid balance
- IV Methylprednisolone 1-2 mg/kg/day + PPI cover
- Antibiotics are not required as standard
- STOP loperamide and codeine.

**PERSIST ≥ 3 days IV corticosteroids**

**Review patient daily.** If no improvement within 72 hours, seek further urgent gastroenterology advice/opinion for management with infliximab.

Inform the Acute Oncology Team of the patient’s assessment and/or admission as soon as possible.
Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.
WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.

http://www.esmo.org/Guidelines/Supportive-and-Palliative-Care/Management-of-Toxicities-from-Immunotherapy
Investigations:
• Re-check LFTs and INR every 3 days.
• Consider imaging for metastases/clot.
• Consider checking paracetamol levels.

Treatment:
• Commence prednisolone 1mg/kg/day (max 60mg OD).

Actions:
• Withhold ICI treatment until the adverse reaction resolves to Grade 0-1 or returns to baseline.
• Medications Review: STOP regular paracetamol, NSAIDs.
• Concomitant medications can exacerbate liver toxicity in this scenario. Therefore discontinuation of ALL non-essential medication is advisable on admission.
• Discuss requirements for CT scan after USS with hepatologist.
• Discuss requirements for liver biopsy with hepatologist.
• If Grade 3 cease treatment. Rechallenge only at consultant discretion.

Inform the Acute Oncology Team of the patient’s assessment and/or admission as soon as possible. Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota. WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Guideline 23. Neurological Immune-Related Adverse Event (irAE)

Neurologic irAEs can manifest as central abnormalities (e.g. aseptic meningitis, encephalitis) or peripheral sensory/motor neuropathies (e.g. Guillain-Barre Syndrome). Early recognition and treatment of neurologic irAEs is critical to its management. As neurologic symptoms can be common in subjects with cancer, it is important that an evaluation/workup can distinguish between non-drug-related causes (e.g. progression of disease, concomitant medications, infection) and a possible drug-related AE as the management can be quite different.

Mild (Grade 1)
- Asymptomatic
- Loss of deep tendon reflexes or paraesthesia (including tingling)
- Not interfering with function or ADLs not concerning to patient.

Moderate (Grade 2)
- Sensory alteration or paraesthesia (including tingling)
- Some interference with function
- Cranial nerve problem
- Symptoms concerning to patient.

Severe or Life-Threatening (Grade 3-4)
- Severe or disabling symptoms;
- Limiting self-care and ADLs
- Life-threatening (e.g. respiratory problems).

Investigations:
- Comprehensive neurological exam.
- Review alcohol and medications history – opiates.
- FBC, U&Es, ALT; cortisol, TFT, glucose, B12 and folate. HIV, TSH.
- Consider autoimmune and vasculitis screen.
- Consider MRI/MRA brain/spine +/- CSF exam to exclude other causes e.g. CVA, brain metastases.

Investigations:
- Neurological examination.
- FBC, U&Es, ALT, cortisol, TFT, glucose, B12 and folate. HIV, TSH.
- Consider autoimmune and vasculitis screen.
- Consider MRI/MRA brain/spine +/- CSF exam to exclude other causes e.g. CVA, brain metastases.
- Alcohol history and medications – opiates.
- Special investigations guided by clinical picture of specific disorders.
- Consider nerve conduction studies or EMG for lower motor neuron and/or sensory changes.
- Consider pulmonary function, sniff, and diaphragmatic function tests.

Management:
- Regular close monitoring for progression.
- Consider withholding ICPi for 1 week whilst monitoring.

Management:
- Delay ICPi.
- Daily monitoring for progression.
- Consider neurology referral and review.
- Treat symptoms per local guidelines.
- Consider IV methylprednisolone 0.5-1mg/kg/day methylprednisolone or oral prednisolone 0.5-1mg/kg/day (max. 60mg/day) + PPI.
- Consider pregabalin or duloxetine for neuropathic pain.
- Consider orthotic devices.

Inform the Acute Oncology Team of the patient’s assessment and/or admission as soon as possible. Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.

http://www.esmo.org/Guidelines/Supportive-and-Palliative-Care/Management-of-Toxicities-from-Immunotherapy

PERSIST > 5 days WORSEN or RELAPSE

Resolved or Improved (Grade 1) Continue with ICPi.

PERSIST > 5 days WORSEN or RELAPSE

Resolved or

Discontinue Immune checkpoint inhibitors (ICPi) permanently
- See steroid taper guidance - guideline 27 P.37.
**Pneumonitis**

**Immune-Related Adverse Event (irAE)**

Pulmonary irAEs have been observed following treatment, they have occurred both after a single dose and after as many as 48 treatments. The frequency of pulmonary AEs may be greater with immunotherapy combination therapies than with monotherapy and more common in lung cancer than in melanoma. The majority of cases reported were Grade 1 or Grade 2 and presented with either asymptomatic radiographic changes (e.g. focal ground glass opacities, patchy infiltrates) or with symptoms of dyspnoea, cough, or fever. Subjects with reported Grade 3 or Grade 4 pulmonary AEs were noted to have more severe symptoms, more extensive radiographic findings, and hypoxia.

**Clinical Assessment & O2 SATS**

**Investigations:**
- Sputum sample for MC&S and PCP PCR
- Baseline bloods (FBC, U&Es, LFT, Ca²⁺, CRP)
- Chest X-ray - baseline for further assessments
- High resolution CT Scan (HR CT)

**Actions:**
- Monitor symptoms every 2-3 days and re-image if worsening
- Consider delay of ICPI

**WORSEN**

**Assess response to treatment within 48 hours.**

**Mild (Grade 1)**
Clinically asymptomatic with radiographic changes only (e.g. focal ground glass opacities, patchy infiltrates).

**Moderate (Grade 2)**
Mild to moderate new onset of symptoms limiting instrumental ADL (e.g. dyspnoea, cough, fever, chest pain).

**Severe/Life-Threatening (Grade 3+ 4)**
Severe new onset of symptoms limiting self-care ADL; or Hypoxia (new or worsening); or Acute Respiratory Distress Syndrome (ARDS).

**Admit patient**
Refer to specialist chest physician

**Clinical Assessment & O2 SATS**

**Investigations:**
- Sputum sample for MC&S
- Baseline bloods (FBC, U&Es, LFT, Ca²⁺, CRP)
- High Resolution CT imaging (HR CT)
- Bronchoscopy +/- lavage.

**Treatment:**
- If no evidence of infection commence Prednisolone 0.5 - 1mg/kg/day (max. 60mg/day prednisolone) + PPI.
- Consider antibiotics (ABX) If evidence of infection.

**Actions:**
- Hold ICPI
- Consider hospital admission
- Refer to a chest physician
- Monitor symptoms daily with clinical examination review if symptoms worsening (with repeat imaging).

Inform the Acute Oncology Team of the patient’s assessment and/or admission as soon as possible.

Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

**WITHHOLD!** SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.

Please see Guideline 27 on P.37 for advice regarding management of patients receiving high dose or long-term steroids.

**http://www.esmo.org/Guidelines/Supportive-and-Palliative-Care/Management-of-Toxicities-from-Immunotherapy**
Guideline 25. Renal Toxicities

Immune-Related Adverse Event (irAE)

Elevated creatinine and biopsy confirmed tubulointerstitial nephritis and allergic nephritis have been infrequently observed following treatment with immunotherapy agents. The frequency of renal AEs may be greater with combination therapies than with monotherapy. Most cases were Grade 2 or Grade 3 and based on creatinine elevation. Patients with a history of RCC or prior nephrectomy do not appear to be at higher risk. Events were managed with corticosteroids and in all cases renal function partially or fully improved.

Symptoms: Resolve or Improve to Mild
See steroid tapering guidance – see guideline 27, P.36.

Symptoms: PERSIST (≥ 5 days) or WORSEN or RELAPSE

Symptoms: Resolve or Improve to Mild
See steroid tapering guidance – see guideline 27, P.36.

Inform the Acute Oncology Team of the patient’s assessment and/or admission as soon as possible. Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota. WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.

Mild (Grade 1)
Creatinine < 1 – 1.5 x increase from baseline
= Stage 1 AKI.

Moderate (Grade 2)
Creatinine > 1.5 - ≤ 3 x increase from baseline
= Stage 2 AKI.

Severe or Life-Threatening (Grade 3 + 4)
Creatinine > 3 x ULN
= Stage 3 AKI.

Investigations:
• Weekly creatinine monitoring

Actions:
• Ensure well hydrated
• Continue ICPI
• Review concomitant medication and stop nephrotoxic drugs.

WORSEn

Detect AKI by using one of the following criteria:
• A rise in serum creatinine of 26 micromol or greater within 48 hours.
• A 50% or greater rise in serum creatinine known or presumed to have occurred within the past 48 hours.
• A fall in urine output to less than 0.5 ml/Kg/hour for more than 6 hours in adults and 8 hours in young people.
• A 25% or greater fall in eGFR in young people in the last 7 days.

Investigations:
• Vital signs
• FBC, U&Es, LFT, cortisol, TFTs and glucose
• Urinalysis-
  • Protein positive- urine sample protein creatinine ratio
  • Blood positive- urine sample to microbiology for casts
  • If blood and protein in urinalysis send for both -protein creatinine ration and casts.

Treatment:
• If clear urinalysis-institute adequate hydration, withhold nephrotoxins and repeat blood in 24 – 48 hours
• If positive urinalysis commence 1mg/kg/day oral prednisolone + PPI

Actions:
• Monitor creatinine every 48 hours
• Exclude other causes
• Review concomitant medication and stop nephrotoxic drugs.
• Prompt referral to renal team for further advice - consider renal biopsy/USS.
• HOLD ICPI until adverse reaction resolves to Grade 1 or Grade 0 or returns to baseline.

Admit patient
Urgent referral to renal team for renal biopsy/USS and urgent advice

Investigations:
• Vital signs
• FBC, U&Es, LFT, cortisol, TFTs and glucose
• Urinalysis-
  • Protein positive- urine sample protein creatinine ratio.
  • Blood positive- urine sample to microbiology for casts.
  • If blood and protein in urinalysis send for both - protein creatinine ration and casts.
  • Daily weight
  • Exclude other causes
  • Monitor creatinine daily
  • Fluid balance.

Treatment:
• IV methylprednisolone 1-2mg/kg/day + PPI
• IV hydration as indicated.

Actions:
• Discontinue ICPI
• Review concomitant medication and stop nephrotoxic drugs.

VITAL SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
**Guideline 26. Skin Toxicities Immune-Related Adverse Event**

Dermatological irAEs common and although they are typically mild to moderate in severity, if left unrecognised or untreated, they can become life-threatening. These toxicities can be managed effectively in almost all patients by using established guidelines that stress vigilance and the use of corticosteroids and other immunosuppressive agents when necessary.

**Grade 1**
Skin rash, affecting <10% Body Surface Area (BSA) with or without symptoms

**And**

**Grade 2 (Moderate)**
Skin rash affecting 10% - 30% of BSA with or without symptoms.

**Clinical Assessment:**
- Exclude other causes e.g. virus, medication.
- If substantial symptoms present – escalate to amber.

**Investigations:**
- NEWS
- FBC, U&Es, LFT, cortisol, TFTs and glucose
- Photograph rash
- Measure lesions.

**Treatment:**
- Anti-histamines – topical or oral
- Topical steroids
- Topical emollient.

**Actions:**
- Regular monitoring- consider daily review.
- Skin care advice
- Consider dermatology referral and skin biopsy.
- Continue ICPI treatment as planned.

**WORSEN**

**Grade 3**
Skin rash affecting >30% of BSA or grade 2 with substantial symptoms.

**Clinical Assessment:**
- Exclude other causes e.g. virus
- If severe symptoms e.g. exfoliative, ulcerative, purpura – escalate to red.

**Investigations:**
- NEWS
- FBC, U&Es, LFT, cortisol, TFTs and glucose
- Photograph rash
- Measure lesions.

**Treatment:**
- **Mild to moderate** - Prednisolone 0.5 – 1mg/kg /day for 3 days then taper over 1-2 weeks + PPI.
- **Severe** – i.v. Methylprednisolone 0.5 -1mg/kg /day and convert to oral on response, taper over 2-4 weeks + PPI.
- Anti-histamines
- Emollient with paraffin content.

**Actions:**
- Withhold ICPI treatment
- Dermatology review - consider punch biopsy
- Monitor daily
- Consider admission to hospital if clinically indicated.

**PERSIST (≥5 days), WORSEN or RELAPSE**

**Grade 4**
Skin sloughing >30% BSA with associated symptoms:
- Generalised
- Exfoliative
- Ulcerative
- Bullous dermatitis
- Purpura.

**Clinical Assessment:**
- Exclude other causes e.g. virus
- Admit patient for monitoring and further management
- **URGENT dermatologist review.**

**Investigations:**
- NEWS monitoring
- FBC, U&Es, LFT, cortisol, TFTs and glucose
- Punch biopsy
- Fluid balance assessment and monitoring
- Photograph rash
- Measure lesions.

**Treatment:**
- Commence i.v. hydration in cases of extensive bullous/desquamating rashes.
- i.v. Methylprednisolone 1-2 mg/kg/day + PPI.
- Anti-histamines
- Analgesia
- Emollient
- Antibiotics are not indicated unless there is a concern of recurrent infections and/or recommended by treating clinician.

**Inform the Acute Oncology Team of the patient's assessment and/or admission as soon as possible.**
**Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.**
**WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.**

http://www.esmo.org/Guidelines/Supportive-and-Palliative-Care/Management-of-Toxicities-from-Immunotherapy
Guideline 27. Management of patients receiving high dose or long-term steroids for irAE’s.

Many patients will receive moderate- to high-dose steroid therapy for their immune-related toxicity for several weeks. Length of tapering is usually dictated by the severity of the irAE. Regular monitoring during tapering is strongly advised, as there is an increased risk of irAE recurrence. PPI cover should be maintained during tapering process. Steroid tapering should only be considered when symptoms are improving.

<table>
<thead>
<tr>
<th>Suggested oral steroid tapering:</th>
<th>Suggested intravenous steroid tapering:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Corticosteroid taper over at least 3-6 weeks.</td>
<td>• Corticosteroid taper over at least 6 weeks.</td>
</tr>
<tr>
<td>• Reduce prednisolone dose by 10mg every 3 - 7 days (as toxicity allows) until dose is 10mg/day.</td>
<td>• Continue IV methylprednisolone 2mg/kg/day for a total of 3-5 days then switch to oral e.g. prednisolone max. 60mg/day.</td>
</tr>
<tr>
<td>• Once steroid dose is 10mg/day, reduce by 5mg every 5 - 7 days then stop.</td>
<td>• Methylprednisolone 1mg/kg/day x 3 days, then switch to oral e.g. prednisolone max. 60mg/day.</td>
</tr>
<tr>
<td>• Patients will need regular blood test and symptom monitoring during tapering.</td>
<td><strong>Upon discharge:</strong></td>
</tr>
<tr>
<td>• Ambulatory monitoring may be possible with regular telephone review and local blood testing.</td>
<td>• Reduce prednisolone dose by 5 to 10mg every 7 days (as toxicity allows) until dose is 10mg/day.</td>
</tr>
<tr>
<td></td>
<td>• Patients will need regular blood test and symptom monitoring during tapering.</td>
</tr>
<tr>
<td></td>
<td>• Ambulatory monitoring may be possible with regular telephone review and local blood testing.</td>
</tr>
</tbody>
</table>

**CAUTION** - during and after the tapering process as the adrenal axis may be suppressed and there is a risk of iatrogenic hypoadrenalism– if symptoms occur follow adrenal crisis guidance – guideline 18 on P.28.

Insomnia:
This is the most common steroid-related side effect. Sleep hygiene counselling is important. Patients may require short-term use of 1st line treatment for insomnia e.g.zopiclone.

Hyperglycaemia:
A baseline HbA1c should be requested at steroid initiation and random afternoon blood sugar monitoring (BM) should be undertaken whilst on treatment. If new hyperglycaemia is detected, Endocrinology advice should be sought (many patients will require short term insulin in this setting). Pre-existing diabetes may require escalation in oral hypoglycaemic agents or insulin.

Osteoporosis:
Vitamin D and calcium levels should be taken at baseline and if low, replaced as appropriate. In patients on steroids for >3 months, or with pre-existing osteoporosis, a bisphosphonate should be considered e.g. weekly alendronic acid.

Infection:
In patients receiving the equivalent of prednisolone 25mg for > 6 weeks we suggest PJC prophylaxis with co-trimoxazole (80/400mg Monday/Wednesday/Friday).

Prophylactic antifungals i.e. Fluconazole and monitoring of patient’s oropharynx.

If patients are on other immune-modulatory agents e.g. Mycophenylate mofetil, consideration may be given to CMV prophylaxis with valgancyclovir, especially if CMV IgG negative and lymphopenic.
Guideline 28. ABDOMINAL ASCITES (Management Pathway)

Ascites is the accumulation of protein rich fluid in the peritoneal cavity and can be classed as an exudate or transudate. Ascites typically develops in the setting of recurrent and/or advanced cancer, the commonest sites being ovarian, breast and colorectal.

Identify: Patients who have received/receiving systemic anti-cancer treatment or are at risk of disease related immunosuppression or a history of stem cell transplant. These patients may be myelosuppressed/neutropenic and at risk of sepsis. If present, this should be managed as per guideline 12 on P.20 - immediate antibiotics if sepsis suspected.

Observations: Calculate NEWS score.
Investigations: FBC, U&Es, LFT, Clotting screen, Albumin, consider CRP in spontaneous bacterial infection, CXR, AXR, Abdominal USS.

Signs and symptoms: abdominal pain and distension; dyspnoea; bulging flanks with dullness to percussion; nausea; vomiting; increased fatigue; dyspnoea; decreasing appetite.

Grade 1 (Green)
Asymptomatic; clinical or diagnostic observations only; intervention not indicated.

- Check all blood results and act on abnormalities e.g. neutropenia or pancytopenia.
- Arrange for elective admission for insertion of ascitic drain under USS control in accordance with local guidelines/practice.
- Discuss with Acute Oncology team.
- Telephone/review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen.

Grade 2 (Amber)
Symptomatic; medical intervention indicated.

Grade 3 (Red)
Severe symptoms; invasive intervention indicated.

Grade 4 (Red)
Life threatening consequences; urgent operative intervention indicated.

- Check all blood results and act on abnormalities e.g. neutropenia or pancytopenia.
- Admit as an emergency and arrange for urgent drainage of ascites under USS control.
- Plan further management in accordance with trust local guidelines depending upon differential diagnosis.
- Discuss with the Acute Oncology team.

Inform the Acute Oncology Team of the patient’s assessment and/or admission as soon as possible.

Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Guideline 29. CARCINOMATOUS LYMPHANGITIS (Management Pathway)

Carcinomatous lymphangitis refers to a diffuse infiltration and obstruction of the pulmonary parenchymal lymphatic channels. It is associated with many malignancies but 80% are adenocarcinomas, predominantly breast, but also lung, colon and stomach.

Clinical presentation:
Clinically patients present with:
Increasing breathlessness
May also have a progressive dry cough or haemoptysis.

Radiation pneumonitis/treatment related pulmonary fibrosis should be considered as can cause similar symptoms.

Diagnosis is based on clinical suspicion in a patient with metastatic cancer and appropriate symptoms. Chest X-rays can appear normal in 30-50% of cases, but characteristic changes include:
• Bronchovascular markings with irregular outlines
• Reticular-nodular shadowing
• Bilateral lower lobe changes.

Investigations: consider checking ABGs.

Other more general changes include:
• Hilar and mediastinal lymphadenopathy
• Pleural effusions.

High resolution CT Scanning is the investigation of choice if CXRs are equivocal or the clinical picture is not obvious.

Treatment:
Corticosteroids (such as dexamethasone 4mg bd, with appropriate PPI cover and not be taken later than 2pm to avoid insomnia) may be beneficial to aid in the management of the associated dyspnoea.

Discussion with the patient’s oncology team is warranted as to whether there are any systemic oncological treatments available, as treating the malignancy itself is the only long-term option.

Unfortunately, the prognosis of patients who develop carcinomatous lymphangitis is poor, with less than 50% surviving 3 months.

Consider urgent referral to the palliative care team for symptom management and advice.

Inform the Acute Oncology Team of the patient’s assessment and/or admission as soon as possible.

Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Guideline 30.
CENTRAL VENOUS ACCESS DEVICES (CVAD) PROBLEM MANAGEMENT - RISKS AND COMPLICATIONS.
There are several risks and complications related to the insertion and maintenance of CVADs. These are briefly discussed below. If you have any concerns relating to any of the following problems please refer to your Local Management Guidelines or contact your Acute Oncology Team.
Removal of the line is not always necessary; please seek appropriate advice from your Acute Oncology Team or the 24-hour oncology on call rota before removing a line.

Infection
Localized infection: Tunnel infections can occur in skin tunnelled CVADs, around the insertion site of PICCs or in the port pocket. These areas should be examined prior to access and/or daily by HCP or self-monitoring for any signs of redness, swelling or discharge, pain or tenderness at the exit site. Absence of discharge does not rule out local infection because if a patient is neutropenic, pus may not be produced. If neutrophils are in normal range and the patient is well and apyrexial, localised infection can be treated with oral or intravenous antibiotics according to the clinical condition of the patient at that time. Lack of response to antibiotics should be acted upon quickly so that infection does not progress further.

Luminal infection: Often presents as pyrexia/shivers/rigor following catheter flushing. If untreated this can progress to septicaemia. If a CVAD infection is suspected the patient should be admitted to hospital for blood cultures and intravenous antibiotics. This is a serious complication of CVADs and can be life threatening if the patient has recently received chemotherapy and is neutropenic.
Any health professional caring for a patient with a CVAD must be able to recognise the signs and symptoms of sepsis. First dose of antibiotics for patients with neutropenic sepsis should be delivered as per national directives within 1 hour of arrival to hospital to injection time. If present, this should be managed as per guideline 12 on P.20 - immediate antibiotics if sepsis suspected.
Seek advice regarding line removal from the Acute Oncology Team or the 24-hour oncology on call rota.

Thrombosis
Thrombosis is the formation of a clot within a blood vessel. Signs and symptoms of thrombosis secondary to CVAD insertion include; pain in the arm, shoulder or chest, swelling, auxiliary blood vessel formation. Thrombosis should be managed according to locally agreed guidelines.

Phlebitis
This is the inflammation of the intima of the vein and it can be mechanical or infective in origin. Mechanical phlebitis is most common in PICCs and can occur within 72 hours to a week of CVAD insertion. Signs and symptoms include pain, erythema, warmth, and a venous cord may be palpable. Mechanical phlebitis can be treated effectively with application of heat pads every 4-6 hours for 20 minutes at a time. Patients should also be offered analgesia as required. CVADs should not be removed without seeking appropriate advice from the AOS Team.

Haematoma
This results from uncontrolled bleeding around the site of insertion. It is a hard and painful swelling with infiltrated blood. Hirudoid cream can be used to soothe and relieve bruising and haematoma: 5-15cm of cream applied over affected area up to 4 times daily and gently massaged into the skin. Firstly check if the patient is taking any anticoagulant therapy or aspirin. Also check platelet count and clotting.

Catheter Migration
Although secured in place, the catheter tip can migrate from its desired position just above the right atrium. This can be due to the patient being very active, or the catheter not being secured properly or in the case of skin tunnelled catheters poor granulation may result in the Dacron cuff slipping. The sign is that the length of the catheter outside the body gets longer. It is important to always check the length before any manipulation of the catheter. If the Dacron cuff is visible or the length of the PICC is greater outside the body, chest x-ray will be required to confirm the position of the catheter tip. Symptoms of catheter migration can include pain in the neck and a rushing sound in the ear during flushing. Management will depend on tip position but may require removal of device.
Unable to aspirate blood
Patency of CVADs should be established prior to administration of any drug or solution (RCN 2010). This is to ensure that any risk of extravasation is minimised. Occlusion can be termed complete, partial or withdrawal occlusion.

**Complete occlusion** can be due to a clot or drug precipitation within the line or a fibrin sheath completely enveloping the device. It results in an inability to either withdraw blood or infuse liquids.

**Partial occlusion** can be due to a small blood clot within the catheter or an external obstruction, for example a twist or a kink in the catheter. It results in difficulty withdrawing blood.

**Withdrawal occlusion** can result from a fibrin tail or malposition of the tip of the catheter and results with inability to withdraw blood but fluids can be administered with ease.

Fibrin sheaths can form as quickly as 24 hours following insertion, fluids can be administered but aspiration of blood is impossible as the fibrin acts as a valve (Amesur 2007). Consider cathetergram when diagnosing the reason for catheter blockage.

**Unblocking Central Venous Catheters**
Thrombolytics such as urokinase are used to re-establish patency of CVADs obstructed with intraluminal or extra luminal thrombus or fibrin sheath. This agent breaks down fibrin. Thrombolytics should be prescribed by the medical staff and administered by staff that have been trained to do so, only after other reasons for catheter obstruction have been ruled out.

Inform the Acute Oncology Team of the patient’s assessment and/or admission as soon as possible.

Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Guideline 31. Cerebral/or CNS oedema and/or cerebral space occupying lesion. (Management Pathway)

Cerebral space occupying lesion – may be primary disease site or metastatic deposits.

Acute cerebral /other CNS oedema – may be disease related e.g. developing around an intrinsic lesion within the brain tissue e.g. a tumour or an abscess or treatment related in the patient who is receiving radiotherapy.

Identify: Patients who have received/receiving systemic anti-cancer treatment or are at risk of disease related. immunosuppression or a history of bone marrow transplant. These patients may be myelosuppressed/ neutropenic and at risk of sepsis. If present, this should be managed as per guideline 12 on P.19-20 - immediate antibiotics if sepsis suspected.

Observations: Calculate NEWS score.

Investigations: Urgent FBC, U&Es, CT scan of head (If CT negative and strong suspicion of brain lesion, due to clinical presentation, consider MRI brain).

Full Clinical / neurological assessment: Signs and symptoms may include new onset of seizures, headache, visual disturbance, nausea and/or vomiting, cognitive dysfunction, confusion, disorientation and/or memory loss, motor dysfunction, symptoms of stroke.

Questions:
- Cancer diagnosis/primary disease/ known metastatic disease
- Currently receiving or have recently completed SACT treatment
- Currently receiving or have recently completed radiotherapy treatment
- Are the presenting symptoms new?
- Are there any co-existing conditions such as epilepsy, hypertension or medication that may account for the patients' symptoms?

NOTE: If there is no history of previous malignancy please see MUO/CUP guideline 38 on P50.

Grade 1 (Green)
Fully functional status (i.e. able to work) with minor neurologic findings, no medication needed.

• Patients should be discussed with either the Acute Oncology Team or on call oncologist as they may require specialist review and management planning prior to discharge.
• Advise to contact the 24 hour advice line if symptoms worsen or persist.

Grade 2 (Amber)
Neurologic findings present are sufficient to require home care, nursing assistance may be required. Medications including steroids/anti-seizure agents may be required.

• Commence dexamethasone 16mg oral OD (IV if required) with PPI cover
• Anti-epileptic medication if having convulsions.
• Admit for monitoring and care.

Grade 3 (Red)
Neurologic findings requiring hospitalisation for initial management.

• Dexamethasone 16mg oral OD (IV if required) with PPI cover
• Anti-epileptic medication if having convulsions.
• Admit for monitoring, on going assessment and management in accordance with local trust guidelines.
• Early critical care management/advice if deterioration.

Grade 4 (Red)
Serious neurologic impairment which includes paralysis, coma or seizures>3 per week despite medication management - hospitalisation required.

• Note: need for caution in patients with no previous known malignancy if lymphoma suspected, steroids might cause rapid resolution of the tumour, which may make histological diagnosis very difficult. If possible, steroids should be avoided before biopsy if lymphoma suspected. This should also be considered in patients presenting with MSCC.

Referral to the Acute Oncology Team is recommended for all patients, immediate advice is available from the Acute Oncology on call rota.

Patients with no known malignancy will require neurosurgical referral.

Patients with known primary disease presenting with metastatic disease require referral to the Brain and CNS MDT.

Patients on active anti - cancer treatment will require oncological review prior to further treatment.

Consider palliative care referral in patients with poor performance status, advanced disease, for symptom control advice.
Although administration of drugs via CVADs carry less risk of extravasation than peripheral administration, if it does occur the damage is likely to be larger and more severe than with peripheral administration. This is because the event is not likely to be noticed immediately and delays to the treatment of extravasation result in damage limitation rather than cure.

**SUSPECT CVAD EXTRAVASATION IF:**

- The patient complains of pain around the insertion, along the tunnel or over the port area
- There is evidence of redness and swelling around the insertion, along the tunnel or over the port area
- There is visible leaking of the drug via the skin tunnel or around the exit site.

**Extravasation of a vesicant drug should be treated as a medical emergency.**

If it is discovered the local Acute Oncology Team should be contacted; if out of hours use the Acute Oncology on call rota contact. The local extravasation policy should be followed, and recommended antidotes should be administered appropriately.

**SUSPECT PERIPHERAL EXTRAVASATION IF:**

- Patient complains of burning or stinging pain at or around cannula site
- There is evidence of swelling, induration, and leakage at site
- There is resistance on plunger of syringe or absence of free flow of infusion
- There is no blood return (if found in isolation via a peripheral cannula this should not be regarded as an indication of a non-patent vein).

**Action:**

If extravasation occurs during peripheral administration of SACT; **Act immediately** according to your local extravasation guidelines. If a patient presents as an emergency following previous peripheral administration of SACT; **Act immediately** - Extravasation of a vesicant drug should be treated as an emergency. If it is discovered the local Acute Oncology Team should be contacted, if out of hours use the Acute Oncology on call rota contact. The local extravasation policy should be followed, and recommended antidotes should be administered appropriately.

**IMMEDIATE ACTION FOR ALL DRUG CATEGORIES IF CVAD EXTRAVASATION IS SUSPECTED.**

1. If the patient is receiving an active infusion STOP the infusion immediately.

2. Leave the central venous catheter in place.

3. Attempt to aspirate as much drug as possible with a new syringe.

4. For ports, aspirate then remove needle

5. Inform a senior member of the Acute Oncology Team

6. Organise X-ray of line or cathetergram

For vesicant extravasations or large volumes of irritant drugs refer to plastic surgeon as soon as possible after detection.
**Guideline 33. HYPERCALCAEMIA OF MALIGNANCY (Management Pathway)**

**Definition:** A disorder characterised by laboratory test results that indicate an elevation in the concentration of calcium (corrected for albumin) in blood. *Corrected calcium >3.4mmol/L requires URGENT treatment.*

**Questions:**
- Is there a cancer diagnosis/primary disease?
- Are they taking anticancer treatment at the moment or recently? If so what treatment and when did it stop?
- Have they previously suffered from hypercalcaemia?
- Are they taking any other medication? (Stop any calcium supplements).

**Investigations:**
- **ECG** - look for shortened QT interval or other conduction abnormalities
- **Bleeds** – Ca²⁺ adjusted for albumin, Phosphate, PTH, Vitamin D, U&Es.

**Examination:**
- Assess for symptoms of hypercalcaemia and duration
- Fluid balance status.

**Signs /symptoms:**
- Polyuria and thirst.
- Abdominal pain
- Confusion.
- Peptic ulceration
- Cardiomyopathy
- Anorexia.
- Fatigue / Lethargy.
- Seizures
- Muscle weakness.
- Shortened QT interval
- Nausea/Vomiting
- Mood disturbance
- Renal impairment.
- Band keratopathy
- Constipation
- Cognitive dysfunction
- Hypertension
- Coma
- Constipation
- Pancreatitis
- Hypertension
- Coma

**Grade 1 (Green)**
- Corrected serum calcium of >ULN -2.9 mmol/l (ULN = upper limit of normal).

**Grade 2 (Amber)**
- Corrected serum calcium >2.9 - 3.0 mmol/l
- Often asymptomatic and does not usually require urgent correction.

**Grade 3 (Red)**
- Corrected serum calcium >3.0 - 3.4 mmol/l
- May be well tolerated if risen slowly, but may be symptomatic and prompt treatment is usually indicated.

**Grade 4 (Red)**
- Corrected serum calcium >3.4 mmol/l
- Requires urgent correction due to the risk of dysrhythmia and coma.

**Check FBC, ESR, U&Es, LFT, TFT, PTH, cortisol, vitamin D & myeloma screen,** start IVI & seek advice from endocrinologist – consider new cancer. Review need for any drugs, which may affect renal blood, flow e.g. NSAIDs, diuretics, ACEIs, ARBs

**If 1st episode of hypercalcaemia,** give 2-4 litres of 0.9% sodium chloride IV followed by zoledronic acid 4mg IV in 100ml 0.9% sodium chloride. or pamidronate, dose according to corrected calcium. Seek advice from endocrinologist. Review need for any drugs, which may affect renal blood, flow e.g. NSAIDs.

**If creatinine clearance is <30ml/min (GFR<10), do not give bisphosphonate SEEK ADVICE. Zoledronic acid dose needs to be reduced if renal impairment present.**

**Recheck U&E & calcium after 4-7 days or sooner if need to monitor fluid replacement.**

**DO NOT GIVE FURTHER BISPHOSPHONATE UNTIL AT LEAST 4 DAYS AFTER PREVIOUS DOSE**
- Maximum effect not seen yet – there is a risk of hypocalcaemia if further bisphosphonate given too soon.
- If calcium remains elevated SEEK Endocrinology/ oncology ADVICE regarding second line management.
- Check calcium weekly, levels remain high and it is 3 weeks or more since last dose of bisphosphonate, give zoledronic acid 4mg IV; if less than 3 weeks since last dose of bisphosphonate, SEEK Endocrinology/ oncology ADVICE especially if renal impairment

**Inform the Acute Oncology Team of the patient’s assessment and/or admission as soon as possible.**
- Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.
- WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.

**http://www.endocrineconnections.com/content/5/5/G9.full**
Guideline 34. HYPMAGNESAEAMIA (Management Pathway)
A disorder characterised by laboratory test results that indicate a low concentration of magnesium in the blood. Many cancer drugs can lead to hypomagnesaemia for example cisplatin, carboplatin, liposomal doxorubicin, cabozantanib, cetuximab, and panitumumab. Other drugs commonly used in cancer patients, e.g. diuretics, gentamicin and other aminoglycoside antibiotics, can cause or contribute to low magnesium. Patients with severe treatment related diarrhoea are also at risk. Normal magnesium range = 0.70 – 0.99 mmol/L (values will be lab assay specific).

Hypomagnesaemia is often detected on blood tests when the patient is being assessed for other reasons therefore most patients are asymptomatic as the levels are only mildly depressed (> 0.50mmol/L).
When serum magnesium levels drop more significantly (< 0.50mmol/L) most patients have non-specific symptoms but they may then go on to develop:
Cardiac or muscle related symptoms such as weakness, cramping, tachycardia / palpitations.
Neurological complaints can be that of vertigo, ataxia, depression, and in severe cases seizures or altered mental state.
Investigation: ECG and consider continuous cardiac monitoring. Check potassium levels and Ca²⁺.
Note: review antiemetics there may be contraindications in patients with low magnesium. Review PPIs and stop if possible as these are frequent causes of hypomagnesaemia.

Examination Findings:
Neuromuscular Irritability: Hyperactive deep tendon reflexes; muscular fibrillation; +ve Trousseau (facial nerve hypersensitivity) & Chvostek (metacarpal hyper flexion) signs; dysarthria or dysphagia secondary to oesophageal dysmotility.
CNS Hyper sensitivity: Irritability and combativeness; disorientation; psychosis; ataxia, vertigo, nystagmus & seizures.
Cardiac findings (ECG): Paroxysmal atrial and ventricular dysrhythmias; repolarisation alternans.

Grade 1 (Green) < LLN - 0.5 mmol/L.
- These patients are typically asymptomatic.
- Consider oral Magnesium replacement to avoid a fall to critical levels: Magnaspartate Mag Glycerophosphate (Discuss with pharmacy).
- Encourage Mg rich diet e.g. spinach, pumpkin seeds, avocado, almonds, figs, swiss chard.

Grade 2 (Amber) < 0.4- 0.5 mmol/L.
- Consider oral Magnesium replacement to avoid a fall to critical levels: Magnaspartate Mag Glycerophosphate (Discuss with pharmacy).
- Check bloods in 24- 48 hours.
- Correct any other electrolyte imbalance as necessary.
- Encourage Mg rich diet e.g. spinach, pumpkin seeds, avocado, almonds, figs, swiss chard.

Grade 3 (Red) < 0.3 – 0.4 mmol/L.
- Admit for administration of Magnesium Sulfate by intravenous infusion.
- Correct any other electrolyte imbalance as necessary.
- Consider continuous cardiac monitoring.

Grade 4 (Red) < 0.3 mmol/L Life threatening consequences.
- Admit for administration of Magnesium Sulfate by intravenous infusion.
- In severe cases such as cardiac arrhythmias Magnesium Sulfate can be given as a bolus but under HDU / ITU supervision.
- Consider continuous cardiac monitoring.

https://bnf.nice.org.uk/drug/magnesium-sulfate.html#indicationsAndDoses

Inform the Acute Oncology Team of the patient's assessment and/or admission as soon as possible.
Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.
WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific
Guideline 35. Hyponatraemia Management Pathway (2 page guideline)

Hyponatraemia can be defined as serum sodium <135 mmol/L. The clinical significance of hyponatraemia depends on its severity, its speed of onset and its underlying cause. Severe hyponatraemia can be life threatening.

Initial Assessment
Observations: Calculate NEWS score. Fluid balance.
Investigations: FBC, U&E. Cortisol, Thyroid Function, LFT, Serum Osmality, to confirm true hypo-osmolar hypoNa. Plasma Glucose to exclude hyperglycaemia as a cause. Urine osmolality and Na+

Symptoms:
1. Severe
   - Vomiting
   - Cardiorespiratory arrest
   - Seizures
   - Reduced consciousness
   - Coma - GCS<8

2. Moderately severe
   - Nausea without vomiting
   - Confusion
   - Headache

3. Mild or absent symptoms
   - Headache
   - Reduced consciousness
   - Coma

The clinical significance of hyponatraemia depends on its:
* Severity
* Speed of onset
* Underlying cause

Range and degree disease and of co-morbidities.

Management decisions should be based on presenting clinical symptoms rather than the degree of hyponatraemia.

N.B. Severe symptoms are unlikely with serum sodium >130 mmol/L and alternative causes of neurological dysfunction should be considered in this context.

The decision to treat with hypertonic fluid and supervision of treatment should be the responsibility of a senior clinician with appropriate training and skill. The aim is to achieve a 5mmol/l rise in serum Na+ within the first hour, reducing immediate danger from cerebral oedema while minimising the risk of

STEP 1. Patients with severe symptoms require immediate management, irrespective of cause.
Within 1st Hour
IV infusion 150 mls of 3% hypertonic saline or equivalent
Over 20 mins in close monitoring.
Check Na+
IV infusion 150 mls of 3% hypertonic saline or equivalent
Over 20 mins whilst waiting result.
Repeat twice or until 5mmol/l increase in

Follow up management after 5mmol/l rise in Na+
Stop infusion hypertonic saline
Keep IV line open with minimal volume 0.9% saline
Start diagnosis –specific management
Limit increase in Na+ to 10mmol in first 24h
Limit increase Na+ to additional 8mmol/l every 24h thereafter until Na+ 130mmol/l

STEP 2 recommended approach if no improvement following 5mmol/l rise in Na+ in the first hour
IV infusion 150 mls of 3% hypertonic saline or equivalent
Over 20 mins in close monitoring environment
Aim additional 1mmol/l increase in Na+
Indications for stopping infusion
Symptom improvement
Na+ increases >10mmol/l in total or 130mmol/l (which ever is first).
Explore other causes of symptoms and refer to endocrinology for further advice and guidance.

N.B. The severity of symptoms may not match the degree of hyponatraemia: profound hyponatraemia may be symptom free, while some patients with moderate biochemistry may have significant signs and symptoms.

Mild: 130–135 mmol/L.
Moderate: 125–129 mmol/L.
Profound: <125 mmol/L.

http://www.endocrineconnections.com/content/5/5/G4/F3.expansion.html
Differential diagnosis of hyponatraemia following emergency treatment.
Measurement of urine osmolality and urine Na+ concentration is central to defining the aetiology of hyponatraemia.
Please see following page (P47) for further guidance.

Inform the Acute Oncology Team of the patient’s assessment and/or admission as soon as possible. Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota. WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Guideline 35 continued. Hyponatraemia Differential diagnosis
Hyponatraemia can be defined as serum sodium <135 mmol/L. The clinical significance of hyponatraemia depends on its severity, its speed of onset and its underlying cause. Severe hyponatraemia can be life threatening.

Differential diagnosis of hyponatraemia following emergency treatment

Hyponatraemia

Urine osmolality

<100 mOsm/kg

Primary polydipsia,
Inappropriate iv. fluid
Low solute intake

Heart failure
Portal hypertension
Nephrotic syndrome
Hypoalbuminaemia
Third space loss
GI loss
Previous diuretic use

>100 mOsm/kg

Urine Na+ <30 mmol/l

SIADH
AVP-like drugs
NSAID
Salt wasting
Vomiting
Hypoadrenalism
Cerebral salt wasting

Urine Na+ > 30 mmol/l

Heart failure
Portal hypertension
Nephrotic syndrome
Hypoalbuminaemia
Third space loss
GI loss
Previous diuretic use

Taking diuretics or ACEI

Urine Na+ >30 mmol/l

Consider all other causes

https://eje.bioscientifica.com/view/journals/eje/170/3/G1.xml
https://cks.nice.org.uk/hyponatraemia - Isenario

Inform the Acute Oncology Team of the patient’s assessment and/or admission as soon as possible.

Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Guideline 36. MALIGNANT PERICARDIAL EFFUSION (Management Pathway)

An accumulation of fluid within the pericardial sac leading to an effusion can be a presenting symptom in acute oncology patients. Two thirds of cancer patients have subclinical pericardial effusions with no overt cardiovascular signs or symptoms. 50% of cases initially present with symptoms of cardiac tamponade. Symptoms are often attributed to underlying cancers and are often a pre-terminal event; however, prompt diagnosis and management can achieve significant palliation.

Causes
Most malignant pericardial effusions result from direct malignant involvement with the pericardium. Other, rarer causes of effusions in cancer patients include radiation-induced pericarditis or chemotherapy-induced pericarditis associated with agents such as doxorubicin or cyclophosphamide.

Clinical Findings
Dyspnoea (majority), fatigue, or asthenia may be the initial symptoms. Monitor oxygen saturation and consider ABGs

Other common symptoms include:
• Cough
• Chest pain
• Orthopnoea.

On examination, findings include:
• Elevated JVP
• Tachycardia
• Hypotension
• Pulsus paradoxus (an abnormally large decrease in pulse and systolic blood pressure (>20mmHg) with inspiration)
• Kussmaul's sign (increased distension of jugular veins with inspiration).

Diagnosis:
• Chest X-ray may show a widened cardiac shadow
• Echocardiography shows the size of the effusion and haemodynamic consequence
• ECG to investigate small ECG complexes.

Questions:
• Cancer diagnosis/primary disease
• Cardinal questions related to breathlessness.

Differential diagnosis would include:
* Chest infection
* Pulmonary embolism (PE)
* Disease progression i.e. consolidation / pleural effusion
* Ascending aortic aneurysm
* Due to indwelling intravascular catheter

Grade 1 (Green)
Small effusion with no haemodynamic consequence.

Grade 2 (Amber)
Moderate effusion with no or minimal haemodynamic consequence and good left ventricular function.

Grade 3 (Red)
Effusion with haemodynamic consequence.

Grade 4 (Red)
Cardiac tamponade - life-threatening consequences;

• Admit patient for on-going assessment, monitoring and symptom management.
• Withhold anticoagulation.
• Consider immediate therapeutic drainage if cardio-vascular compromise.
• Treatment is best managed with urgent referral to cardiology or cardiothoracic surgical teams – contact SpR on call.
• Inform Acute Oncology Team.
• All treatment options should be balanced against the patient’s symptoms, overall performance status, level of disease and predicted benefits.

• Enquire regarding signs of sepsis/productive cough - escalate to Grade 3 Red as appropriate.
• Discuss with the Acute Oncology team prior to discharge for ambulatory management.
• Early referral to cardiology for management advice.
• Telephone/review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen.

Inform the Acute Oncology Team of the patient’s assessment and/or admission as soon as possible. Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.

WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Guideline 37.  
MALIGNANT PLEURAL EFFUSION  
(Management Pathway)

Contact the respiratory team and inform the acute oncology team

Proven malignant pleural effusion

NO
Observe unless drain advised for other reasons

Symptomatic?

YES

Long life expectancy and limited systemic disease

NO

Systemic therapy likely to lead to rapid resolution.

Follow local pathway for insertion of Intercostal tube and drainage.

YES

Consider referral to thoracic surgeons for thoracoscopic drainage / pleuradesis / PleurX or other indwelling catheter.

NOTE: there may be an ambulatory service available locally for the management of stable patients requiring drainage of pleural effusion – contact the respiratory or acute oncology team for advice.

Inform the Acute Oncology Team of the patient's assessment and/or admission as soon as possible. Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.  
WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Initial Assessment
Observations: Calculate NEWS score.
History: Full history including rate of change of symptoms. Assess and record current performance status and co-morbidities.
Assessment/establish patients understanding and wishes with regards to investigation and treatment pathway.
Examination: Complete clinical examination (including breast, PR, PV, testicular and skin examination)
Laboratory Investigations:
• All patients: FBC, U&Es, LFT, Ca\textsubscript{2+}, LDH, CRP.
• Men with midline disease /brain metastases: Serum aFP and bhCG.
• Women with pelvic or peritoneal disease: CA125.
• Men with bone metastases: PSA.
• Patients with liver only disease: aFP.
• Consider myeloma screen - for bone lesion seen on scan with no obvious primary – immunoglobulins/electrophoresis, serum free light chains and urine for bence jones protein.
• If FBC is abnormal – request blood film which may demonstrate a haematological malignancy such as lymphoma/leukaemia or suggest the possibility of bone marrow metastases.
• Urinalysis for blood.
• Patients with altered bowel habit: consider CEA.
Note: other tumour markers are generally not useful in diagnosis.
Imaging:
• CT thorax, abdomen and pelvis is the staging investigation of choice in most circumstances.
Other investigations:
• Other investigations (including endoscopies) only as indicated by signs and symptoms.
• Patients with a solitary metastasis should be referred to the appropriate specialist team before biopsy.
• All other patients, assess fitness and suitability for biopsy to establish histology to guide future treatment.
• Detailed clinical information on the request form is essential.
Further management:
• Discuss with the Acute Oncology Team.
• If clinical, radiological and pathological findings suggest a specific cancer primary refer to relevant MDT (please see guidance below).
• Otherwise refer to unknown primary MDT and/ or Acute Oncology Team (consider local protocol).
• Please ensure patient is informed of results and plan for onward referral –some patients may be managed as outpatients if the appropriate infrastructure is in place.
• Early referral to palliative care for advice on symptom management and continuing care should be considered where appropriate.
Patterns of disease requiring URGENT specific action:
Spinal cord compression – urgent admission and referral to acute oncology team and/or spinal cord co-ordinator.
Men with midline disease – urgent referral to oncology (? germ cell).
Superior Vena Cava Obstruction - urgent referral to lung MDT for consideration of stent.
Suspected lymphoma, myeloma, plasmacytoma – urgent referral to haematology.
Patterns of disease requiring specific action:
Men with bone metastasis and elevated PSA – referral to urology MDT.
Women with axillary nodes – referral to breast surgeons/ MDT.
Women with peritoneal disease – referral to gynaecology /MDT, unless histology suggests non-gynaecology origin.
Solitary liver lesion – requires referral to hepatobiliary MDT.
Neck nodes – requires referral to head and neck or neck nodes clinic as appropriate locally.
Isolated brain metastasis – requires referral to neurology MDT.
Always make sure that the Acute Oncology Team are informed of patient’s assessment and/or admission as soon as possible. Immediate advice is available from the Acute Oncology on call rota.
Guideline 39. PNEUMONITIS - Radiation or chemotherapy induced (Management Pathway)

Definition: A disorder characterized by inflammation focally or diffusely affecting the lung parenchyma

Signs and symptoms of radiation or chemotherapy induced pneumonitis:
Clinical pneumonitis, or inflammation of the lung(s), can often display non-specific signs. These can include:
- Mild hypoxia
- Pleural rub/effusion
- Fine crepitations – widespread if drug induced, localised if following focal radiation
- Low grade fever
- The development of acute or sub acute dyspnoea, which after history and examination does not reveal pneumonia, tumour recurrence, or any other specific aetiology
- In addition to dyspnoea, there may be a new or worsening cough.

Clinical radiation pneumonitis may develop in 20% of lung carcinoma patients:
- The median time to onset of symptoms is 3 weeks after radiation therapy (but may be up to 3 months).

Initial Assessment:
- Clinical evaluation, history, physical examination and review of observations
- Chest X-ray
- Calculation of Wells score
- CT (high resolution and CTPA) to exclude cancer progression and pulmonary embolus
- Monitor oxygen saturation and consider ABGs.

Grade 1 (Green)
No new symptoms.

Grade 2 (Amber)
Dyspnoea/symptoms on exertion.

Mild or moderate symptoms, manageable on an outpatient basis.

High dose steroids e.g. prednisolone 50mg od with PPI cover.
Specialist advice needed for ongoing steroid dosing.

Grade 3 (Red)
Dyspnoea/symptoms at normal levels of activity.

Severe symptoms requiring hospitalisation
Review by chest physician.

Treat with high dose steroids:
- Intravenous – methylprednisolone 1-2mg/kg od with PPI cover
- Oral - prednisolone 50mg od with PPI cover
- Inhaled.

Monitor closely as Urgent intervention may be indicated (e.g. tracheotomy or intubation).

Grade 4 (Red)
Dyspnoea/symptoms at rest or requiring ventilatory support.

Inform the Acute Oncology Team of the patient’s assessment and/or admission as soon as possible.
Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.
WITHHOLD! SACT, including oral therapy, until you have discussed with the Acute Oncology or Site Specific Team.
Guideline 40. SUPERIOR VENA CAVA OBSTRUCTION (SVCO) (Management Pathway)

SVCO is an obstructive emergency that may occur as the result of progression of a malignancy or may be the diagnostic symptom. SVCO is caused by external pressure, thrombus or direct tumour invasion causing obstruction of the superior vena cava and occurs in 3-8% of patients with cancer.

Questions:
- Cancer diagnosis/primary disease
- Cardinal questions related to breathlessness

Differential diagnosis would include:
- Chest infection
- Pulmonary embolism (PE)
- Disease progression i.e. consolidation / pleural effusion
- Ascending aortic aneurysm (due to indwelling intravascular catheter)

Signs and symptoms:
- Dyspnoea
- Stridor- due to laryngeal oedema
- Non-pulsatile JVP
- Headaches
- Dilated anterior chest wall veins
- Confusion
- Chest pain
- Swelling of face and neck
- Coma

Investigations: CTPA to define tumour extent, site of occlusion or stenosis and extent of any thrombus. SVCO can be an incidental finding on CT.

Seek advice from the Acute Oncology and/or the Respiratory team as soon as possible to guide investigations and management.

Grade 1 (Green)
Oedema in head or neck, vascular distension, cyanosis, plethora.

Grade 2 (Amber)
Oedema in head or neck with functional impairment (mild dysphagia, cough, visual disturbances).

Grade 3 (Red)
Mild or moderate cerebral oedema (headache, dizziness) or mild/moderate laryngeal oedema or diminished cardiac reserve (syncope after bending).

Grade 4 (Red)
Significant cerebral oedema (confusion) or significant laryngeal oedema (stridor) or significant haemodynamic compromise.

- Enquire regarding signs of sepsis/productive cough - escalate to Grade 3 Red as appropriate.
- Consider steroid therapy to manage symptoms of oedema and prevent deterioration.
- Enquire if history of underlying chest complaints e.g. asthma, COPD – advise patients around usual management of exacerbations advise to discuss with GP or other associated health professional managing this condition.
- Discuss with the Acute Oncology team – arrange urgent oncology and/or respiratory review.
- Telephone/review patient within 24 hours and ask patient to contact the 24-hour advice line if symptoms worsen or persist.

- Admit for further assessment and on-going management.
- Monitor for evidence of:
  - Desaturation
  - Infection
  - SACT/chemotherapy toxicities
  - Haemodynamic compromise.
- Address life threatening symptoms e.g. stridor.
- Treatment initially aimed at symptom management.
- Commence high dose steroids + PPI – if not contraindicated.
- Seek Urgent Advice from the Acute Oncology and/or the Respiratory team to guide investigations and management.

Manage in accordance with trust local guidelines depending upon differential diagnosis and clinical status. Further management may include:

- Stent insertion – performance status
- Chemotherapy – performance status
- Radiotherapy – any contraindications e.g. previous radiotherapy to chest. Inability to lie flat.
- If thrombus is present consider anticoagulation if no contraindications.

Inform the Acute Oncology Team of the patient’s assessment and/or admission as soon as possible. Immediate advice is available from the Acute Oncology Service or the 24 Hour Oncology on call rota.
WITHHOLD! SACT, including oral therapy until you have discussed with the Acute Oncology or Site Specific Team.

**Acknowledgements**

The UKONS Board and project leads wish to thank:

- The development group of the original set of guidelines V.1

- The Clatterbridge Cancer Centre NHS Foundation Trust and The Royal Marsden NHS Foundation Trust for sharing their original Immune-Related Adverse Event (irAE) management guidelines which have been used to develop guidelines within this document

- The development group, specialist advisors and consultation group members for helping throughout the project.
